NEWS IN BRIEF

DAP first foreign order

ICL has picked up its first overseas order for the Distributed Array Processor. The as yet unnamed customer is described as "a public body located outside Europe". It will use the DAP with a 2982 mainframe for meteorological and image processing applications. The machine ordered will have a 64 x 64 array like the DAP already in operation at Queen Mary College in London.

Streaker debut

A MAGNETIC tape drive called Streaker, and another known as Streamer are to be marketed in the UK by CIU Computers of Woking under an agreement with the manufacturers, Data Electronics of the USA. Intended as back-up to fixed disc media, Streamer is capable of a 90K-bytes per second transfer and has its own formatter/controller subsystem, while Streaker has no such facility.

Back-up growth

AMERICAN research company HCC issued a report predicting 46 per cent annual growth in the back-up storage market. Although discs are indicated as the key 1980-1986 growth area, a tape revival is forecast for archive back-up.

New standard?

THE International Standards Organisation's seven-layer architecture for open systems interconnection has been registered as a draft proposal for an international standard and a document prepared at the architecture working group's meeting in Berlin last week will be circulated for comment to national standards bodies next month.

A better line of communication

SBS launches its first satellite

SATELLITE Business Systems had its first satellite launched by NASA from Cape Canaveral last weekend, in preparation for offering integrated voice and data networks to private companies early next year.

After taking 24 minutes to get up, it will slowly work its way towards its final position in geostationary orbit 22,250 miles up 106 degrees west of Greenwich, ready to start carrying test traffic in about a month.

SBS expects the satellite's capacity of 480Mbps to be taken up within a year and its second satellite is due to go up next April. General Motors is the latest of 11 customers to be announced.

Others include Westinghouse, Boeing Computer Services and several insurance companies, as well as IBM and Aetna Life and Casualty which own SBS in partnership with satellite operator Comsat.

Live traffic is due to be carried early next year. Customers can lease channels of up to 1.5Mbps capacity and it is planned to implement channels of 3.5M and 6.3Mbps capacity when they are requested.

The system uses time division multiplexing with dynamic allocation of the capacity and is said to be suitable for voice, data, facsimile and some types of video traffic.

Unions hold fire on ICL sackings

MAJOR clerical and technical staff unions are to meet ICL on a national level next Monday in a bid to persuade the company to reconsider its plan for redundancies at manufacturing centres like Winsford, where 1,500 jobs are under threat.

Representatives of the unions, including ASTMS, APEX, AUEW (TASS), ACTSS and ESSA, met this week to consider the company announcement, but agreed to defer direct action against ICL.

Their respective research departments will draw up a report listing major points of concern.

Last week, workers at Winsford occupied the plant briefly as a protest against the redundancies. Commenting after this week's meeting, Tim Webb, national officer of ASTMS, the largest union involved, said: "Obviously our main concern is that ICL is moving away from being a manufacturing base and leaning more towards franchise."

"This is a national level issue relating to company policy. We want the company to delay making the cutbacks until the points which will be made in our report have been considered."

Explaining ICL's decisions to close the Winsford plant and to seek other manufacturing redundancies, ICL deputy managing director Peter Ellis said last week that new technology was reducing the labour content in ICL's manufacturing sector by about 30% a year while hardware shipments were now expanding by about 15% annually.

Ellis pointed out that the hardware shipments growth rate of 25% a year achieved about two years ago had enabled ICL to avoid major redundancies in the past.

will be made in our report have been considered."

MP slams 'misuse' of state computer

BIRMINGHAM MP Jeff Rooker (Lab, Perry Bar) is to raise in the Commons the use of a State industry's computer to support a private health scheme. Rooker said the decision to allocate time on the Midland Electricity Board's IBM 3032 to collect contributions to the Private Patients Plan was a "disgraceful misuse" of public money which undermined the interests of National Health Service patients.

He has written to Energy Secretary David Howell asking if the board's promotion of a private health scheme falls within its legal powers. The question will be asked in the next session of Parliament.

The board's deputy chief accountant Gordon Sands said the scheme was merely another voluntary deduction from salary like those for safety footwear and private insurance. Each employee from the chairman down was offered membership of the scheme, which he was entitled to refuse.

He added that the board had been with the BUPA private health scheme for nearly 20 years and made deductions for it for many years. This year the board had negotiated what he believed to be a better scheme and the matter had been discussed formally with local trades unions in August.

The disputed Domino program, demonstrated by Brian Moore of P J Equipment, an authorised dealer.

Domino program leads to more copyright action

by Claire Gooding

ANOTHER row has broken out between micro software dealers Molmerx and Kansas City Systems over an alleged violation of software copyright. Kansas City Systems is selling a domino-playing program for the Tandy TRS 80 which A. J. Harding of Molmerx claims is a copy of "Dominoes" marketed by his company.

Harding's solicitors have written a "before action" letter of protest to Tom Crossley of Kansas. Harding told Computer Weekly that in the absence of a satisfactory reply he would seek to extend the injunction granted recently by Justice Graham over Kansas' unauthorised use of Molmerx's Level III Basic (CW, November 13).

The row stems from a discovery made by the author of Dominoes, computer service engineer Barry Dunn, who sold his program to A. J. Harding and gets a 20% royalty on each copy sold by Molmerx. Interested to compare the new version with his own, Dunn ran a copy of Kansas' domino game (bought by a friend through mail order) only to find it almost identical.

IBM three-stage launch programme

THE operating system supporting the IBM 3081 is to be MVS/SP Release 1 which supports the existing 3180 and will be available for the 3081 in June 1981.

Release 2 of MVS/SP is due in July and will provide cross-memory services and Global Recovery facilities. A technical support processor will be available automatically and have no workload shifted without interruption to other processors.

Further innovations are planned for Release 3 in November 1981, which are designed to increase performance and reliability. The plan is to achieve this by microcoding, using less storage and reducing processor time expended in paging.

JOB OPPORTUNITIES: Pages 18-37

Surprise win for RCA in £6m deal for 60 ops

by Kevin Cehill

THE biggest prize currently available in the UK contract market has been won by non-contract supplier RCA Services. The job, worth £6,000,000, is to supply 60 plus operators to the European Space Agency for its European computer centres.

The order is a major coup for Sunbury-on-Thames based RCA, and succeeds that held by Knight Computer Services, the BOC Data-solve subsidiary which withdrew from the contract in July following difficulties with the German tax authorities.

Industry sources expressed surprise that an order of this size had gone to RCA, which is not widely known in the contract operator market. But RCA points out that it already has a series of agreements for maintenance and servicing of equipment at ESA sites on the continent.

And Richard White, one of the managers responsible for the contract at RCA, says that the job will be staffed by RCA personnel, not contract staff.

In some cases RCA would be offering employment to the existing operators, who would be joining the staff of RCA. Knight did not tender for a renewal of its contract, and has an agreement with ESA not to comment to the press on aspects of it which led to Knight severing contacts with its operators two months ago.

RCA won the contract against competitive bids from other companies. These included Resource Technology from Bushey, whose boss Ian Penman, commented: "It is wrong to award European jobs to American companies in the middle of a recession in Europe. The dollar is very cheap in relation to the pound and mark. This gives the Americans an unfair advantage."

The European Space Agency replied that RCA had been established in the UK since 1936 and all the jobs would be going to Europeans.

Penman indicated that he would be taking the matter up with his MP.

The ESA has a range of ICL 2980s System 471s, and IBM equipment. The bulk of the staff will work at the ESA headquarters in Darmstadt, Germany.

Amdahl rival for H-series

MICROCODE is used extensively in the 580, Amdahl's answer to the first IBM H-series machine, the 3081, which was announced last week (CW, November 20).

While moving away from the much less flexible hardwired structure of its existing 470 series computers, Amdahl has retained two other features - air cooling and a uniprocessor architecture.

At £2 million for a 16-megabyte, 16-channel machine, the price-performance of the 580 looks similar to the 3081.

The 580 offers more than twice the power of the existing Amdahl top end computer, the 470V/8, but is only two-thirds the physical size and dissipates only two-thirds of the heat. But in contrast to the 470s, which were twice as cool as earlier IBM mainframes, the 580 is slightly less cool than the 3081.

Peter Williams, managing director of Amdahl UK, believes that the 3081 only uses water cooling because the design decision was made by IBM five years ago.

The uniprocessor architecture of the 580 will enable it to run the Airline Control Program, a facility that cannot be provided by the dual processor IBM 3081. So Amdahl's chances of breaking into more IBM based airlines around the world will be improved.

BRIEFING... BRIEFING... BRIEFING

2,500 staff get notice

ICL served redundancy notices to 2,500 staff on Tuesday, despite strong pressure to reconsider its cutback policy from the technical and staff unions involved.

The company is considering proposals made by the unions at a meeting on Monday.

Commodore plans

COMMODORE International is moving into the electronic cash register business next year, and has also announced plans to set up an integrated circuit plant in Europe. Its latest venture is in the low-cost personal computer market. See Micro News, page 9.

Amdahl for Shell

AMDAHL has broken into another major multi-national company with its first order from oil giant Shell. The data processing division of Shell Nederland BV in Den Haag has ordered a 12-megabyte 470V/7 which will be installed in January next year.

Answer delayed

BURROUGHS has admitted that the B3950, announced in April last year as its answer to the IBM 4300 series, has still not met specification. The company is unable to say when 3950 deliveries will start and is shipping an "extended" version of the 2900 in its place. The main problems appear to be with instruction pre-fetch code.

Memorex appeal

MEMOREX is undeterred after losing its recent appeal against the US Federal Court's decision in its marathon and costly suit against IBM. Three US Ninth Circuit Court of Appeals judges upheld the District Court verdict, favouring IBM, reached in the original 1978 trial. Now Memorex will seek an "en banc" hearing before the Ninth Circuit, which means re-consideration by a 10-15 strong panel of appeals judges.

FBA emulation on your CKD devices

- VFBA gives support for virtual FBA disks on normal CKD devices
- Use of VFBA reduces CKD overheads to that of normal FBA devices
- VFBA runs under VM, but does not modify VSE, AF or CMS
- Full or part pack minidisk support
- VFBA means 'removable' FBA files

Downtime

by Chad

Who'll be first for the latest acronym?

ARE you a keen follower of developments in ODF? Those in the know, always ready with the latest jargon, are of course aware that ODF means Office of the Future, an interesting concept for speculation if you don't have to worry too much about reality.

Television people have been jumping at every chance to film electronic office systems and call them "paperless", even if they are manifestly not so.

Still, we can dream, can't we? That's why I referred to the Paperless ODF at a conference the

other day, and was promptly corrected by a young lady who insisted I should call it POOF.

Well, folks, is this how a new acronym appears in the language? Who's going to be the first to use it?

ON our canteen menu for lunch the other day was "Roast lamb and mince sauce". It tasted just the same as ever. Do you suppose someone has invented a voice recognition word processor, despite this newspaper's scepticism?

One-sided conversation

LAST week, the technology of telephone answering machines; this week, the social impact. (We're nothing if not thorough on C.W.)

A friend of mine has one of these machines and it works

satisfactorily, would you believe; and an incident with another party has brought home to me how much people need to re-adjust their psyches to survive in this wonderful electronic age.

A lady acquaintance wanted to get something from the chap with the machine, and rang to see if he was in.

His machine said, "I'll be back at 3.30." Fine, thought the lady in her innocence, and walked the mile and a half to his house at the appropriate time.

Was he there? No, he wasn't. He hasn't bothered to change his announcement yet in weeks.

Now, you or I know, in our technical sophistication, how easy it is to forget to make sure such things as that announcement are correct. We would have phoned again at 3.30 just to make sure (wasting some more money

in the process — an ordinary phone would just not answer, giving us the information we require for free).

The lady has not yet learnt technical cynicism — that which makes you hover ready to grab the cup when it inevitably jams in the coffee machine.

This is, I must admit, speculation, that I would not believe the machine. The first time I heard that announcement it was 6pm, and that would be enough to make the most trusting soul smell a rat!

The other part of the lady's not fitting in with the world was having to walk. If she had had a car the wasted journey would not have been serious. Perhaps the assumption that everyone is motorised led to the man's not worrying too much about accuracy in his announcement.

FOCUS

Making friends with Ada

EVERY two years, or so it seems, a major programming language is discovered, and "Ada" is the current pin-up.

This particular model is little different from previous breakthroughs. Once again the discovery has been heralded as a language which will profoundly affect the computer industry as a whole. Praise has been lavished on Ada by the BBC, the US Department of Defence and the UK National Physical Laboratory.

So far enthusiasm appears to be in muted mode from the DP institutions and manufacturers.

While the Ada package might well assist the role of the US nuclear submarine fleet, its relevance in domestic applications has yet to be proved.

Computer Weekly suggested earlier this month that one objective of Ada was to hide surplus details from the user. Security is all very well, but deliberate suppression of the facts as opposed to the more conventional method of carelessness or misguidance would appear to infringe industry codes of conduct. Maybe the ever-vigilant British Computer Society should investigate.

First

It has been hinted that Ada was a friendly counterpoint with close connections with the pioneer of computing, Babbage. Ada herself is generally acknowledged to have been the world's first programmer. If so, then our understanding of acronyms is due for a re-evaluation. DIANE, for example, has a role in European telephone networks. Whether the name involved Direct Information Access Networks For Europe or The Goddess of Huotling, is unclear.

Until recently, the DP industry managed to get by with messy configurations. If you could fit your 3380 from your 8380, you Model 23 from System 32, then you could move on five places. Two turns later the player has to identify such alpha cryptics as ASCII and CCITT. RAM and ROM or CMOS and CMOS. Now, however, identification is much easier. The first-time user can choose between an Apple, Pet or Acorn. Not that microcomputer users will be worried about Ada, which is a major language tool of interest only to major real time users.

Ada is not just an advanced programming language. It also relates to automation and robotics which is probably the reason for its original name, Ironman. The development and promotion of Ada is such that a complete solution to all software problems is being claimed. No doubt such claims of absolute learning as "Loughborough and Beaumont" are already raising next year's course syllabus.

Classic

That there is a need for a standard advanced level language project with an emphasis on modularity seems proved. Cobol is frequently criticised as monolithic, but several hundred versions currently in operation, such a term seems inappropriate. Fortran, meanwhile, remains the classic scientific language while Algol is in a degenerate mode. At the same time, BASIC, APL and Pascal are flourishing.

Among other programming languages which seem to have been left on the coding shelves are SNOBOL, probably a basic language for climatologists, and Lisp — a clear failure to pronounce aloud its communication merits.

In the meantime, the NCC, well respected instigator of high level standards, has recently announced some "user friendly" software packages. Perhaps the NCC should undertake a thorough evaluation of Ada.

MICHIE'S PRIVATEVIEW

Heuristic and deep models of human skill

THE structure of a human expert's skill can be subdivided into two major components. In machine intelligence terms we speak of a heuristic model and a deep model. Great conveniences attend treating these two models as separate.

The dichotomy reflects the fact that (with some variations from one domain to another) a consultant or other person with a highly trained question-answering skill can usually answer the overwhelming majority of clients' questions "off the top of his head", just as a Fischer or a Karpov when playing under the time constraints of lightning chess can usually find a master move in five seconds (less than 200 binary decisions in terms of human compute time).

Expertise

The discovery that a domain specialist's top-of-the-head skill can be replicated by relatively simple and uniform computational structures, based on pattern-driven situation-action rules, is what has led to the recent rapid de-

velopment of expert systems such as MYCIN, PROSPECTOR, PUFF, VM, SACON, and others.

It is not generally understood that given an appropriate choice of domain a sufficient level of expertise can often be implemented using just a heuristic model of this kind, with no need for the more difficult and costly task of constructing an adequate deep model. By a "deep" model we mean a representation of the domain's logical and causal structure together with procedures for search, calculations, and reasoning, with which recommendations for action may be dug out from the model.

In other domains the ideal system incorporates both types of model as separate sub-programs, and links them appropriately. Some well-studied examples (see figure 1) will help to illustrate these points.

The three examples have been deliberately chosen for being tractable by use of heuristic models. They are probably not tractable by implementation of deep models alone. The three examples in figure 2 present a sharp contrast

here and the same problem has in each case stimulated successful implementations using both kinds of model.

Improved

The simplest way to combine the two kinds of model in a single system is for the deep model to be used as default to answer those questions where top-of-the-head rules fail, whenever exit occurs from the heuristic model through failure to find an adequate pattern match. Retrospective analysis of the first case (subtitled pole-balancing) showed that such combination would have greatly improved the economics of each, but in different ways. The run-time skill of BOXES could have benefited by access to a deep model, and the run-time costs of Eastwood's program by access to a heuristic model.

As is inevitably the case in general, implementation costs of the deep model were large compared with those of the heuristic model.

Beware of expensive imitations.

Your situation.

The chances are, you are thinking of buying a computer. The task you face is daunting. Which of the numerous systems do you choose, and how much should you pay for it? Which system would really be able to meet your immediate requirements? These are only a few of the questions you must be asking yourself.

Our answer.

Honeywell has the logical answer. Level 6 — from one of the world's leading manufacturers. In price, performance and flexibility, Level 6 minicomputers have proved that they cannot easily be beaten.

They will also ensure that the right people get the right information at the right time in the right place — both now and in the future.

Level 6 minicomputers grow as you grow. Supplied through specialised distributors, they can handle a wide range of applications. Among them are stock control; payroll; accounting; production control and scheduling; property management; job matching; ledger administration; sales analysis; order processing; ledger records; wholesale distribution.

And all these applications can be tailored to meet your needs.

Now you can afford to invest in the best.

Disc drive orders 'go through the roof'

ORDERS for the Memorex 635 Mbyte disc drive have "gone through the roof" over the last three months, according to the company's UK managing director Mike Kitching.

He estimates an increase of 200 to 300 per cent since August, which he attributes to previous customer uncertainty being cleared by the June announcement of the IBM 3380 with 1260 Mbyte capacity.

IBM says that 3380 orders are scheduled fully to the end of 1982. Kitching adds: "A customer now has his delivery date - say in 24 months - and has gone out to buy capacity for the meantime."

"The result is that orders have gone through the roof since late August/early September." He estimates a backlog for the 635 Mbyte model 3652 now standing at almost \$5 million.

The other major PCM disc drive manufacturer, Storage Technology, also reports buoyant sales. "We are way over budget," com-

ments UK marketing manager Colin Cook, who has already passed his 1980 target for similar capacity units.

Market share

Kitching says that demand for UK storage capacity is growing at about 35% a year, and that it will be 1983 before IBM can deliver enough 3380s to threaten Memorex's market share.

He claims to have equipment installed in about 320 of the 530 IBM mainframe sites in the UK, and to have 80% of the PCM market.

Cook says Storage Technology has 10 installations with 130 spindles in the 635 Mbyte size. Both PCM manufacturers have announced their 3380 equivalents, the second quarter of 1982 being the earliest date set for first customer shipments. IBM will start deliveries in September 1981.

To match the reduced cost per Mbyte of storage offered by the

3380, Kitching has introduced stepped leasing for his 3652. Customers will continue to pay current Memorex prices until they take delivery of their 3380 and will have their subsequent charge per Mbyte reduced to 3380 levels for the lifetime of their lease.

Storage Technology reports there has been a move to rental agreements, rather than purchase or lease, since the 3380 announcement.

Mobile data terminal launch

PLESSEY has launched a data terminal designed for mobile use with existing radio equipment. Based on the Zilog Z80 microprocessor, it measures 11 x 10 x 8 inches, contains a 315-character CRT display, keyboard, 27K bytes of store and a V24 interface driving a local printer.

Called the UMCT, universal mobile communications terminal, the device transmits and receives at 4,800 bps in bursts of up to 0.6

KITCHING... UK storage capacity demand is growing.

Data flow agreements vital to protect Third World - ILO report

INTERNATIONAL agreements on technology transfer and cross-border data flow are sorely needed if the Third World is not to suffer drastically from impending changes in technology, especially those brought about by computers.

That is the main message of a report on the impact of microelectronics just published by the International Labour Organisation, a body representing unions, governments and employers.

The author, Juao Rada of the Centre for Education in International Management in Geneva, is worried that the embodiment of more technology to products such as machines with firmware included will restrict the scope of developing countries for adding value of their own to components, thereby promoting their own industries.

Balanced

Improved telecommunications will also enable developed countries to provide data processing and database services to the Third World, he feels, so there will be no reason for local services to be set up.

International understanding on these issues is vital, Rada says, so that developing countries can be provided with technologies for their own use and to ensure a "balanced flow" of data. There is plenty of potential benefit for developing countries in new technology Rada feels; these include the saving of capital and skills, and better control and allocation of resources.

The understandings could only be guidelines, not binding rules, Rada asserts, as for instance it is impossible to control the actual flow of data. The most that could be done, he says, is that "everybody would be asked to be good boys."

There has been some misunderstanding of the view expressed in the report on the likely impact of microelectronics on employment. Rada has specifically not made any overall quantitative forecasts because he says it is impossible to do so. It is possible, though, to look at specific sectors and to predict on past experience that there will be displacement of labour. Effects are "likely to be

serious," Rada feels, but he sees the possibility of absorbing the displaced labour in services, not in industry, if enough effort is spent on retraining.

Local conflicts

He disputes the prediction some have made of social turmoil and unrest on a large scale, produced by technical change. He thinks strife will be confined to local conflicts, like the 11-month closure of The Times.

The report, commissioned last year, is the first of several studies the ILO is sponsoring in this area of the impact of technology. Rada will be carrying on more work on the North/South question. The erosion of the developing countries' labour cost advantage by automation could lead to increased dependency on such countries as the US, he thinks, particularly as more production depends on information flows.

French learn by computer

The French government is laying great emphasis on education for the Information Society with 3,000 of a scheduled 10,000 micros already installed in French schools, the remainder following by the end of next year.

Speaking at the London branch of the BCS last week, Philippe Druais, deputy chairman of Cap Gemini Segaud and high priest of French computing for the past 25 years, explained that France was pursuing a more aggressive policy of public awareness than the UK. Over 34% of the general public had been involved, directly or indirectly, in the Information Week sponsored by French President Valéry Giscard d'Estaing last year.

France had enacted a privacy law backed by an independent and aggressive commission which had thrown out a plan to produce computerised and unforgeable replacements for the identity card every French citizen must carry.

Transdata launches multi-language range

A RANGE of microcomputers, suitable for multi-language operation in commercial and scientific applications has been launched by Transdata.

The multi-language operation is made possible by using the CPM Digital Research operating system and should assist the many companies which need to share their hardware among a variety of user departments.

Fortran, Cobol, Basic and APL can all be run on a multi-user package, MP/M, permits different language programs to be run simultaneously.

There are three basic models in the Cx500 range, all employing multiprocessor architecture with a Z80A master processor. Bottom of the range is the £3,500 Cx502 with 64Kbytes of RAM, and dual 8in floppy disc drives. At the top end is the £8,000 Cx504 with 20Mbytes of Winchester disc storage and cartridge tape security back-up.

The company hopes to derive about 40% of its revenue from microcomputer products, with expected turnover growing from about £2m in June 1980 to £3m next June.

Transdata's new national sales manager, Rob Hollands, who joined the company from Perkins Elmer earlier this year, is leading a vigorous sales and market drive.

HOLLANDS... dynamic approach to micro campaign.

BRUNEL UNIVERSITY

Phone: Uxbridge 27184
Ext: 700/701/2
for a course brochure.

THE Japanese Ministry of Trade and Industry, MITI, wants its counterpart in the UK, West Germany, France and the US to co-operate on research into the capabilities that will be required of computers in the 1990s.

MITI's keen interest in an international effort is not surprising because the Japanese government is prepared to contribute only a relatively trivial 15 million yen, about £30,000, next year to the studies being carried out by the Fifth Generation Computer Survey and Research Committee. This is the body set up by MITI last year (CWI, June 7, 1979) to carry out research on the subject.

KEITH JONES discusses a report on the findings to date of the Fifth Generation Committee, published this year by the Japan Information Processing Development Centre, which is working with MITI on the project. Jipdec is a non-profit-making organisation set up in 1987 by the Japanese government with the support of the computer industry to promote information processing research.

Japanese set ambitious fifth generation targets

IN an interim report on study and research into fifth generation computers, the Japan Information Processing Development Centre, Jipdec, outlines features for fifth generation machines which are so ambitious that even the 1990s might not see their emergence.

Some features will be further developments of trends that are already under way, such as an increased use of non-von Neumann architecture and a greater degree of processor specialisation.

But far more exciting and revolutionary will be a concept that Jipdec has chosen to call Knowledge Information Processing, KIP for short.

According to Jipdec, KIP will have two basic functional elements: high-level man-machine interfacing and the ability to solve problems rather than simply process data.

Reasoning

The interfacing capability will enable all forms of information to be input conversationally, including natural language, patterns, images, hand-written characters and speech.

Problem solving looks like involving even more complex functions. Jipdec points out that the fifth generation system will require knowledge of the field covered by the problem and will therefore need to be able to merge fresh knowledge with existing knowledge without contradiction or conflict. Another essential capability will be inductive.

reasoning, the ability to discover order in a collection of data.

A computer for handling these functions would need to be a good deal more than just a number processing machine. Jipdec sees the need for a powerful symbol manipulation computer capable of pattern matching at high speed, separating garbage from meaningful information and, at the highest level, carrying out something akin to reasoning with the use of parallel processing of some form.

Non-silicon

Working with the "reasoning" machine would be a dedicated database computer probably employing a relational structure and performing what Jipdec describes as "relational algebraic calculations".

The report recognises the significance of high performance, non-silicon semiconductor technologies for implementing machines that could conceivably be powerful enough to realise these functions.

Circuitry employing Josephson junction or chemical compound semiconductors, Gallium Arsenide being the best known, are the two most likely choices.

According to the report, the main motivation for the computer industry to tackle much more ambitious applications for computers outside the conventional field of commercial data processing will be an increase in computer price performance so large - up to 100 times - that it will not be matched by a comparable expansion in the

commercial sector.

The computer industry will therefore have to turn its attention to pioneering new application areas, and the report lists a few fundamental needs of which society is considered to be "vaguely aware". One area is easy and immediate access to information, a capability that will require technology that can translate the imprecise information requirements of people into clear requests.

A second fundamental need, according to the report, is for computers' capability to stimulate scientific experiments to be extended to the social sciences. A third requirement is for the de-

velopment of computer-driven robots which will take over a lot more jobs performed now by humans. The report recognises the increasing importance of computer-aided design and manufacture.

The committee set up by Jipdec to carry out the study into fifth generation machines is made up of three sub-committees. One has been assigned the task of writing a social scenario for the 1990s.

A second sub-committee is looking at the basic hardware and software problems that need to be overcome in order that fifth generation machines may become a reality, while the third is studying the device technology that might be available in the 1990s.

Micro sales staff 'have little training'

SHARP criticism of micro retailers and salesmen came from Chris Ryan, head of computer systems at international cinema finance and information group Mills and Allen, at a London branch meeting of the Institute of Data Processing Management last week.

Ryan, whose company makes extensive use of micros, commented that the mainframe, mini and micro sales forces represented a computer industry problem because the majority of these sales people had little training in general business practice.

Dealing specifically with the micro business, Ryan identified two types of salesman: the small retailer with a range of machines to sell and the sales systems consultant.

In the case of micro retailers, Ryan described the person and the problem as that of "having several micros on display, all demonstrated but by someone who hasn't got the time to listen to your problems."

Ryan was more complimentary about systems consultants but pointed out that micro systems consultants in general, like the retailers, lacked technical backup.

Looking to the future, Ryan hoped that the industry would "develop purpose-built parameter driver type-of-business software solutions for each aspect of a particular trade or industry."

To reinforce his points, Ryan introduced on stage Henry Barnett, a licensed bookmaker and entrepreneur.

Barnett has been using a micro for several years for two unusual tasks. He uses a Pet, bought as a toy, to evaluate prospective new betting shops and to estimate when he should begin to lay off bets.

RYAN... "the majority had little business training."

388 delivers

The productivity advances of IBM's new System/38 are being confirmed in early installations.

IBM has started delivering System/38s to customers.

And customers have started delivering comments like these to IBM:

"RPG III and the interactive data base utilities are helping us to implement new systems quicker than we ever thought possible."

Mike Finch, Hospital Savings Association, London.

"I created a special equipment report in 15 minutes flat. Before, it would have taken a day and a half of programming."

Charles Peters, Data Processing Manager, Road Machinery and Supplies Company, Minneapolis.

"We've developed an online order entry system with one-third the effort and the application is much more polished. We're very pleased."

Larry Shinnott, Director, Corporate Information Services, United Merchants and Manufacturers, New York City.

"The System/38 significantly reduced the amount of code necessary to write a program and the time and effort required to move into new applications. We're extremely enthusiastic."

Larry Patterson, Director of Data Processing, St. Olaf College, Northfield, Minnesota.

IBM (UK) LTD, KINGDOM LIMITED

Every computer Wang sells is a perfect fit.

SMALL

Our small business computer product family ranges from the sleek top PCS II and 2200 SVP to the multi-user 2200 LWP and 2200 MVP.

MEDIUM

Our dependable family of interactive virtual storage (VS) computers is easily programmable and can perform word processing functions.

LARGE

Our VS 100 offers big computer power with the best-to-use features of PDP 11 family. It accommodates up to 260 devices.

Whether you're buying your first computer or moving up, you shouldn't have to settle for a general-purpose answer. With Wang, you don't.

From our 2200 series of small business computers to our powerful VS computer family, every Wang system is designed to be specifically tailored - in hardware and software - to do exactly what you need done. From simple bookkeeping to large-scale data processing.

And no matter which Wang system you start with, you can expand easily and affordably, from the smallest to the largest model in the line. And full software compatibility within each product family protects your software investment.

So instead of settling for a computer that's just right for

everybody, call Wang. And get a computer that's just right for you.

Wang (UK) Limited, Wang House, 100 George Street, London, W1, United Kingdom. Tel.: (01) 496-0200.

PROGRAMMERS' PAGE

Heuristics helps to cope with partner problems

LAST week's *Programmers' Page* started a series on problem solving by looking at the brainiac and describing the total search tree to solution, in 11 moves. This week we progress to heuristics and problems too complex for representation by a tree of all possible moves.

The sort-into-sequence is a familiar Christmas stocking filler - it is also an example of a combinatorial explosion (see Fig 1).

Its explosive qualities come from the number of possible moves at each stage. For any particular move there are always two three or four pieces surrounding the space, one of which is moved into the next move.

Times from an initial state on

Estimation

Board games like chess and draughts are problems of the same ilk. The complete solution tree for draughts contains 10^{10} nodes, which under optimum conditions would take 10^3 centuries to examine - or a thousand million billion centuries.

Exhaustive searches are out for

these problems. We need to be more selective, examining only those nodes most likely to succeed. How to recognise them? Obviously some sort of evaluation is needed; one way is to award each move a numerical score.

In the sequence puzzle this could be the distance of each square from its final goal. The total score for all pieces gives an estimate of the number of moves needed to achieve solution, so a lower score is better than a higher and zero means you're there.

At each move the lowest score is chosen as the line to follow, although this is not always fruitful and can lead to loops and the like, in which case the next least score is taken.

This technique of educated but fallible guesswork is known as heuristics. A heuristic for last week's problem of the programmers versus redundancy might decide to evaluate by the number of people reaching the 8th floor.

This would be unproductive because, as was shown last week, at one point to get everyone upstairs it was necessary to send two down again. The evaluation would veto the move and thereby miss the solution.

Compromises

Getting back to the chessboard, is a heuristic feasible? If so, isn't it just what an experienced player does anyway, evaluating several moves in advance?

The big difference with board games lies in having an opponent. That's no revelation, but it does mean that the heuristic must be modified to cope with the two opposing sides.

Mini-maxing achieves this, recognising that an opponent can upset the apparent of a nicely planned heuristic, so compromises by only looking a few moves ahead. Scores for intermediate states are then worked back and a sequence of moves pinpointed.

Mini-maxing a chess game would go something like this: White plays Black, who has just moved. Both players are trying for the highest score from their point of view. Looking at it from White's viewpoint, he plays for a large positive score, but a large negative benefit Black. Zero indicates advantage to neither.

White starts off with a possible three moves - capturing the black bishop (8 points), threatening the black pawn (+1) and endangering his own pawn (-3).

Evaluation

Black may respond to the loss of his bishop by taking the white castle (overall score of -2) or by missing his chance (score remains at 3) nodes 5 and 6 respectively of 2.

Similarly he has options for White's other moves. By this process a tree of all possible moves is built up, with scores at each stage. White, deciding to mini-max to a depth of three moves (see Fig 2).

The scores at the final, terminal states are directly evaluated. Those encountered on the way are effective scores, taking both players' moves into account.

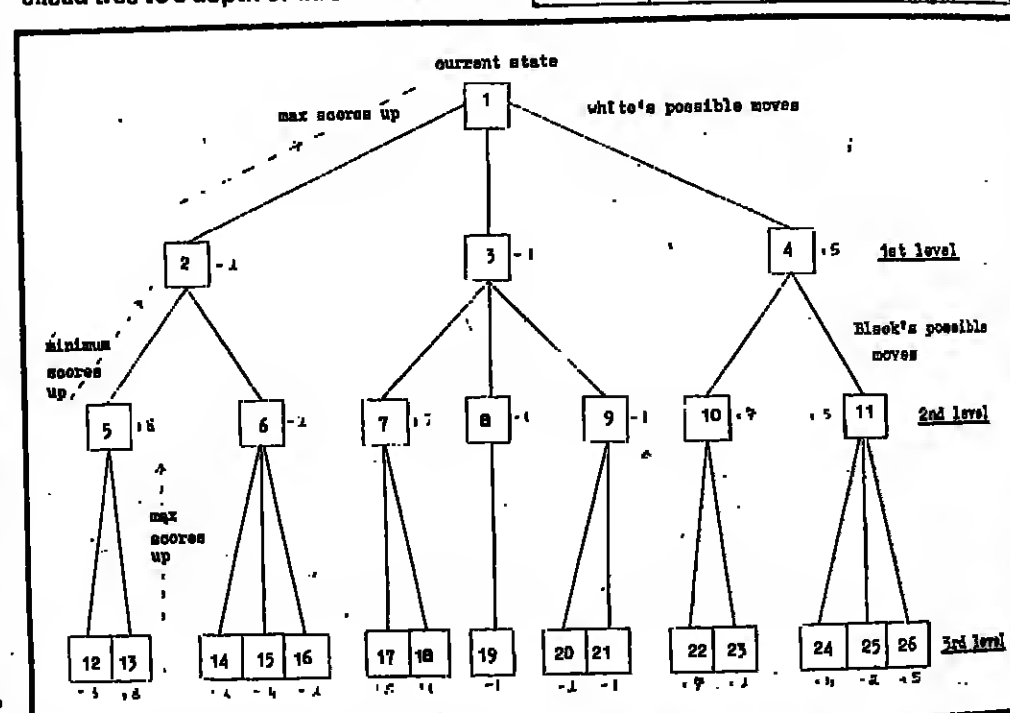

Now comes the mini-maxing and maxing. The effective scores are worked out by passing back the terminal score, depending on whether B or W made the move.

If White's move leads to the terminal 3rd state, the minimum scores are passed back to the 2nd level as there is no White's advantage.

At the previous level, 1st to 2nd - Black's move leads to the

Figure 1 (right): The final state of the sort-into-sequence puzzle.

Figure 2 (below): The mini-maxed look ahead tree to a depth of three moves.

2nd level state so the minimums are passed back to the 1st level. White chooses the move from initial to 1st level state, with the highest possible score, in this case to node 4, score = +5.

Good function

Note that, without mini-maxing, to temper the score of +8 for node 5; to -2 for node 2 (Black's retaliation to his lost bishop for seizure of Castle White). White would probably have opted for this route to node 5 via node 2.

This backwards evaluation is quite straightforward; however, much depends on finding a good function to set the terminal values. For board games this can be tricky and comes down eventually to choosing a few crucial features of the game and testing for them.

In a draughts game these might be promotion of a piece to a King, or the relative strengths of Black and White. Each chosen feature is scored numerically and the total gives the state of the game.

To achieve even finer control, different features can be weighted so that one overrides the other. The two previous examples could be scored: Black's piece promoted to King, -5; numerical supremacy by White, +5, equals zero. The program deems B's King twice as important as the numbers so weights the scores accordingly to result in -10 + 5 = -5.

It can also learn to do better from its mistakes, by adjusting weighting as the game unfolds and redressing imbalances. In a perfect world, the inherited back score from mini-maxing would be the same as direct evaluation. Usually though they vary slightly and the best guessimate needs to be known.

Adjustment

The whole tree of moves to solution is 10^{10} , which would be extremely accurate, but just as unfeasible. The mini-max tree is a realistic compromise involving just a few moves ahead, so is generally a better answer than direct evaluation.

A researcher called Samuel in 1963 devised a program to bring the two scores into line, by adjusting weights. If the direct evaluation was the smaller, all the weights would be enhanced for the positive features.

For instance, a mini-maxed score might be $6\frac{1}{2}$ while the direct was a total of (score of 3 x weight of 2) combined with (score of -2 x weight of 1) = $6 + -2 = 4$. The adjusted direct score to match the mini-max is (score of 3 x wt of $2\frac{1}{2}$) + (score of -2 x wt of $\frac{1}{2}$) = $7\frac{1}{2} - 1 = 6\frac{1}{2}$.

Vice versa for direct scores that are greater. Each new state must go through this process which Samuel called hill-climbing, to describe the slow steady weighting improvement and program performance. Samuel's eventually beat him at draughts.

Having chosen the most important features, improved the weightings, and looked as far ahead as feasible - what now? That's the problem, because short of extending the tree search not much more can be done. Already chess programs take the maximum two to three minutes allowed per move under the master tournament rules.

Sacrificed

An obvious and probably already vocalised-by-you flaw in the limited look-ahead tree is the Big Tree just beyond the search cut-off. As it's out of bounds the program ignores it, making decisions happily, until WHAM - the factor hits home and you may have lost your queen. This was labelled the 'Horizon Effect' by Berliner in 1977.

Even worse, the loss of the queen may have been inevitable but with limited look-ahead the indicated best move was sacrifice of, say, a rook. Knowledge of the queen's impending doom could have changed the situation, the best move, and at least saved loss of both pieces.

What is lacking is an overall strategy and the simple concept of numerical score is not enough to achieve it. Newer programs have strategy built in as pre-stored patterns to illustrate situations which

a threat to two pieces and, paradoxically, or a strong defense position.

When one crops up, the program responds with the question: Can one piece protect both of those threatened? According to the answers received, the program searches out other appropriate patterns, selects a move and checks that it is legal.

The difficult bit, naturally, is defining the patterns and formalising the reasoning in enough detail to write the program.

Possibilities

Humans seem to practice the same sort of pattern strategy. Contrary to popular belief, chess masters do not have phenomenal memories but, since they understand the game so well, can remember situations or groups of pieces. This demands much less from memory.

Neither do they appear to mini-max or follow any system learned. It is much more a question of recognising and opting for a fairly favourable move without knowing or worrying if it is the best possible.

This leads to errors but blunders are expected and accepted as human game-playing. The technique is a short cut, minimising the search for the limited human memory.

Bank TUs report

BANKING trade unions all over the world are urged to pull together on the use of new technology in a report from the International Federation of Commercial, Clerical, Printing and Technical Employees (IFCTE). In Bank Workers and New Technology, the Federation demands that employers consider the introduction of new technology and warns that such things as automatic teller machines, video communication, and the eventual use of point-of-sale terminals will radically alter the banking industry.

MICRO NEWS

Commodore into cash registers

ORIGINATOR of the Pet microcomputer, Commodore International, is about to venture into manufacturing electronic cash registers. The announcement came at the company's recent celebration of three years' success in the UK personal computer market.

A new division is to be formed to market the first cash register, planned for release next year, but developments do not end there.

After reorientating towards the business marketplace, Commodore focuses an explosive lower end of the market among systems like the Sinclair ZX80 and Newbury Laboratories' Newbrala. To compete in this area the company has developed an expandable colour computer system called VIC 20, which should be available in the UK around Easter next year for under £200. Its size will be similar to the Pet keyboard section without the monitor.

Initial launch

The name VIC 20 stands for video interface computer with a 20-column screen. A 40-column version, the VIC 40, should be available by the end of next year according to Kit Spencer, general manager of Commodore UK in Slough.

Based on the 6802 8-bit microprocessor from MOS Tech-

nology, a Commodore subsidiary, the VIC 20 also uses another of its chips called the VIC (video interface chip) which incorporates RAM, ROM and video control circuitry.

Designed and manufactured at Commodore Japan, the VIC 20 is to be launched there first, followed by the US and then the UK.

The reason is to fight Japanese competition on its home base. According to Kit Spencer, Commodore Japan is run completely by Japanese management, so the VIC 20 must be a Japanese product.

With 5K of RAM expandable to 32K, the system will be aimed at the educational and personal market. It will connect to an ordinary colour television set or monitor and run cassette and plug-in ROM modules.

Peripherals under development for use with the single RS232 port, expansion and gain ports, include a tape cassette unit, a single floppy disc drive, a printer and other add-on accessories.

The system with programmable function keys will run Pet Basic, probably 12K of ROM, and Pet software will be adapted to run on it. In addition, special applications packages and games will be available in plug-in ROM form.

Plug-in form

Commodore plans to distribute the VIC 20 to the current 200 dealers in the UK and possibly by another outlet.

A recent IDC survey has rated Pet the number one microcomputer in Europe, and Commodore reckons on having 50-70% of the market.

This percentage can be broken down into areas like business applications which, says Commodore, accounts for 60 to 70% of the total. Education takes 15 to 20%, control applications 10% and the hobbyist marketplace accounts for about 5%.

Kit Spencer says that the company philosophy is to "plan to make products redundant before the competition does".

Using this philosophy, Commodore is planning an enhancement to the 8032 SuperPet, released in

April at the Hannover Fair (CW, June 26). A 96K version should be available in the UK and US at Easter next year.

Under way

Effort is also going into the communications market which is considered by Commodore to be one of the most important areas and around 30 dealers are being trained especially for this field.

The company has been demonstrating a Pet talking to a DEC intelligent terminal at the Which Computer? Show held this week at the NEC in Birmingham.

More plans for next year include the setting up of an integrated circuit plant in Europe. Production at the German microcomputer products plant is now under way at Brunswick and marks the start of plans to localise marketing and manufacturing operations throughout the world.

Early next year will see the appearance of eight-inch floppy discs offering 1½ or 3 Mbytes of storage. At the end of the year a hard disc should become available.

Japanese introduce the ABC

DESIGNED and manufactured by Al Electronics of Japan, the ABC-24 microcomputer marks another Japanese entry to the European marketplace. The ABC-24 is 280-based with 64K of RAM, and two RS-232-C serial ports.

With CP/M, MP/M, DOS/KET and UCSD Pascal, the complete system is available in the UK for £3,000 from London-based Regen International, an associate company of CapScan, the OCR and data preparation bureau. The system will also run Basic, Cobol-80, PL3 and Fortran IV. With additional delay wheel printer and numeric pad, and dual floppy discs provide up to 640K of extra storage.

With CP/M, MP/M, DOS/KET and UCSD Pascal, the complete system is available in the UK for £3,000 from London-based Regen International, an associate company of CapScan, the OCR and data preparation bureau. The system will also run Basic, Cobol-80, PL3 and Fortran IV. With additional delay wheel printer and numeric pad, and dual floppy discs provide up to 640K of extra storage.

Ohio sets up UK operation

US COMPANY Ohio Scientific has set up a UK marketing and sales base in Langley, Bucks, which will incorporate full administration, testing and burn-in facilities to support a planned 30-dealer network.

The previous nine-strong dealer network has been expanded to 14 and Ohio hopes to have recruited a total of 30 by the start of next year. On-site servicing and maintenance is to be carried out by Systems Reliability on a contract or timed-by-the-hour basis.

Ohio will concentrate primarily on two ranges, the C2-D and the C2-OEM. The latter is aimed at the business market and is 6502-based with 48K of RAM costing around £1,900. It comes in a table cabinet with a monitor and printer and features an RS-232 port and two eight-inch floppy disc drives.

Versatility

The more advanced C2-D is available for around £5,000 and incorporates an eight-inch Winchester disc. It comes with 52K of RAM, a serial I/O port, and a single eight-inch floppy disc drive.

Running Ohio Scientific's own small business-oriented operating system, OS-65U, the C2-D can use UCSD Basic, Fortran, a resident Assembler/Editor and 9-digit precision Basic.

Optional software available includes a word processor package (WP-2), a database manager and information management system with a small business accounting package.

Alan Davies, managing director of Ohio Scientific, with the C2-D and C2-OEM systems.

Safety going by default

FEW personal computers in current use in the UK meet the British Standards Institute criteria for safety requirements, especially with regard to power supplies. One that does is the Sinclair ZX80.

These were among the conclusions drawn up at a one-day seminar on testing methods for personal computer systems, held at the Polytechnic of North London's Electronics Department last week.

Objective

The day was organised by the polytechnic, the North London Hobby Computer Club and the Association of London Computer Clubs, and chaired by Robin Bradbeer.

Main objective of the day was to obtain co-ordination between hardware and software evaluation of small computer systems. Users and reviewers contributed ideas which it is hoped will be compiled

into an unofficial format of reviewing next year.

An important point made by reviewers was that the lack of testing areas and facilities made the job difficult and almost impossible to carry out uniformly standardised tests.

Software on personals is becoming more difficult to assess because of higher level languages like Pascal coming into more common use.

It was pointed out that evaluators were often reduced to using "old-beat" tests like placing the system in a typically noisy environment (like the kitchen) to assess interference effects.

Transformer

Several systems reviewed were found to have no fan protection or transformer protection. In one case, a small object (eg, a child's finger) could easily find its way into the back of the system and get

OP SPOT

There are still success stories in British industry, despite the gloomy prognostications of the CBI and other organisations. Two small British companies, based in Surrey and

Staffordshire, respectively, show how to make a significant impact on the highly competitive domestic field of product and service back-up.

Role of ops manager in two success stories

A SURE way of judging the true importance of an ops manager is to assess the extent of his control over budgets and there is a problem of definition here. Depending on the size of the installation, ops managers are anything from the managing director's golden partner to a machine minder minding other machine minders.

David Ball is UK sales manager for Norman Magnetics and his job is to sell and service magnetic media. Ray Tungate has his own company and is in the business of designing and selling computer forms and labels.

For both men the ops manager is a figure of vital importance because it is to him that they go for a buying decision. Both reckon that at least 60% of the ops managers they approach have enough control over their budgets to decide on whether to buy from them or not.

Expanding

Says David Ball: "Although it is the job of the DPM to make major hardware decisions the ops manager usually has the power to make media purchases. In fact, I know of sites where this kind of decision is the responsibility of the senior operator."

Norman Magnetics was formed in 1973 and, from an initial investment of £6,000, has grown into a business which turned over £4.5 million to the last financial year. Based in Farnborough (Hants) it started a US subsidiary in Costa Mesa, California last year.

Some 58% of its business is done abroad, with sales recorded in all major European countries, the Far East, the Eastern bloc and the US. Its overseas success was recognised this year with the Queen's award for export.

However, as the pound gathers strength, the export market is becoming harder to crack. A strong pound might make our package holidays cheaper but it makes the work-a-day world considerably harder for companies like Norman Magnetics.

In this context, it is worth noting that government statistics showed that the British computer industry contributed a net balance of trade deficit of £200 million in 1979. That might be a cause for general gloom, but what is depressing for Norman Magnetics is the following set of figures.

When it started trading overseas £1 purchased 1500 liras, 147 pesetas or 3.8 Deutschmarks. At the time of writing £1 buys 2150 liras, 183 pesetas or 4.6 Deutschmarks. To the Italian or Spanish buyer that means a huge jump in the price of British products; for Norman Magnetics it means slimmed-down profit margins.

So Norman Magnetics has been forced to turn more of its attention to the domestic market. It has already collared a section of the homegrown OEM market and is now paying particular attention to the end user—and the end user is more often than not the operations department.

At present, such sales account

for 15% of the turnover and it is David Ball's brief to put himself about and increase this proportion.

"It's only recently that we have started actively pursuing the end user market," he says. Dealing with individual installations causes more administrative aggravation because orders are smaller than those from multinationals.

Ready-coated

Ball's major problem is getting the name of Norman Magnetics known in a market dominated by the high finance names of Control Data, Nashua, BASF and Memorex. To this end he is advertising, doing direct mail shots and building up his network of personal contacts. So, if he comes knocking at your door, you'll know why.

What he will be selling is a range of recording media including disc packs, disc cartridges, mag tapes and floppy discs. Many of these are manufactured at Farnborough. The firm buys ready-coated discs, mostly from the US. There is a production area capable of assembling and testing over 1,000 cartridges every day.

Non-servo written packs are tested with equipment developed in-house. For servo written packs there are three £250,000 servo writers. And if you place an order, there is a fair chance of immediate delivery because more than six months' stock is stored in a recently completed warehouse.

In the salesperson's argot, Ball's

"unique selling point" is that, as Norman Magnetics is a British concern, it is able to offer swift technical back-up. A back-up and repair service is important, especially with high technology servo written products, and is the backbone of the company's business. Part of David Ball's sales pitch consists of several businesslike anecdotes along the lines of a user who had a head crash on a systems pack.

Guarantee

The supplier couldn't do anything to help and it was vital to retain the information on the pack. Norman Magnetics came dashing to the rescue by furnishing out the head crash on one of its expensive machines and retrieved 90% of the information on it.

Disc packs get broken, scratched, dropped and jumped on. Norman Magnetics' repair service rebuilds, rebalances, resurfaces and drive tests damaged discs from any manufacturer and returns them with a 12-month guarantee.

When I asked David Ball about prices all he was prepared to say was that they were "very competitive". I didn't have the time to compile a survey of disc prices nor could I look at the forms market as a whole.

When I asked Ray Tungate about his prices he shipped more elegantly out of committing himself to anything specific by saying: "The forms market is a bespoke market and therefore has bespoke prices."

Ray Tungate runs a smaller and younger business than Norman

by Paul Fisher

Patrolman is the motif connecting Norman Magnetics' UK sales manager David Ball (left) and export colleague David Drow — with the Mini Mate taking an appropriate centre stage position.

Magnetics. Instead of 100 employees he has a staff of eight. Tungate has spent his whole career in the forms business, having started as a printer.

He set up on his own 18 months ago based on a series of converted 19th century farm buildings which stand in 14 acres of land near Alton in Staffordshire.

Tungate's selling line goes like this: "Most computer forms are drawn and ill-designed. Many operations managers regard forms buying as a chore because there are only marginal differences between suppliers and companies which supply them."

"Computer people fail to appreciate that forms are frequently the main contact of customers with the company, and that impressions of the company are formed by the documents that are seen."

Unafraid of a bad pun, Tungate promises "forms that inform" and launches into his unique selling point. Tucked in the Staffordshire pastures, he has a graphic designer so that he can offer a design service which is available without charge and without commitment.

It's a policy which must be working for him, because among his customers are Horizon Hol-

disys, Stanley Tools, Tarmac and Bassett's, the liquorice shop people.

The forms are printed in colour with tints to attract the eye and give emphasis. The idea is to help "speed reading" and to do away with confusion. In Tungate's opinion, the British market has been an easy one for several reasons.

He says: "The rapid growth in data processing has given the forms companies an easy and fast growing market of undemanding buyers." Because of this, salesmen and DP personnel have had no training in graphic design.

Norman Magnetics and Tungate Forms are true blue Brit and you can expect to hear more from them in the next few months. They might even flatter you with a personal call — but they'll probably go easy on what they have to offer in terms of a service.

Not many people take the idea of patriotic purchasing too seriously. Whatever a person's political or economic beliefs, they are usually conveniently forgotten when, cash in hand, a thing is traded with a view to purchasing it.

SOFTWARE FILE

Insurance market looks promising

THE field of insurance, in which skilled staff expend much time and energy on routine tasks, is beginning to attract attention as a potential software market at both ends of the hardware scales.

Quotel, the GSI bureau whose car and life insurance service is used by many large organisations, (including until recently the AA) is launching a pensions system aimed at the self-employed.

At the bottom end of the same market, but catering for individual insurance brokers, is a system called Muteq which runs on a micro costing under £3,000.

Like all computerised insurance systems, it aims at freeing skilled staff from the mundane jobs of looking up rates and charges so that they can concentrate on tasks demanding personal service. Since Muteq is aimed at small individual installations, it concentrates on

simplicity of use for clerical staff, and easy training.

"We don't give just the cheapest quote, we give the entire range with all the different combinations of charges taken into account," said Tim Dobb of DHK Systems, the company that spotted the potential of a micro insurance application.

"The system also explains the reason behind 'no quote' or referral cases, which appear on the screen — which is more than some larger systems do", he added.

Updated

Once the initial set of hardware — a Z80-based OEM machine called the Perifer 63048 — is overcome, the software costs £108 on a lease basis, and is updated monthly with all changes in charging rates from the various companies on file.

In-house system

THB AA has written an in-house car insurance system to run on its own mainframes, which deals with specific companies, after using Quotel's service as a stopgap.

The AA has taken the optimum path of limiting the companies on file to those it deals with, rather than the whole range as supplied by Quotel. The new system was developed by a four-

man team from the AA's own programming section, writing in Cobol for an ICL 2965 and 2904 under DME.

Taking four months to develop, the AA says the system is now dealing with 2,500 quotes every week, for less than Quotel cost to run, and without the updating problems that used to occur. Quotel is still used at the AA head office.

Although the system draws its estimates from 30 companies at present, there is an overall capacity for 50 and users will be able to have specific companies put on file if not already quoted.

Muteq comes "complete with data (which in fact forms a large portion of the entire system), ready to run on an in-house micro."

Although Muteq is implemented under the DMOS operating system for reasons of security, the machine it runs on can also host the CP/M operating systems, which opens up the possibility of a wide range of applications including word processing.

The system is written entirely in assembly language for speed of response and to make room for the vast amount of data necessary for a comprehensive quotation.

Details of over 2,000 cars are stored on file, and the charging criteria and rates of each individual insurance company takes up 4K bytes.

The final quotation gives a selection across the entire range of companies, giving details on such items as windscreen replacement, which allow the broker to pick out the best value for money.

Quotel's new system gives comparative cost and value-for-money reports on various options open to the self-employed wanting deferred annuity schemes to provide pensions. The system is available to insurance brokers and clients on a bureau basis.

by Claire Gooding

APL gaining more respectability

A SHARE of products catering for the high-level language APL seems to indicate that this powerful programmer's tool has won a measure of commercial respectability at last.

Most of APL's power — and its drawbacks — reside in its hieroglyphic instruction set, which requires a purpose-built keyboard and printer.

Recent micro-implementations of APL have tried to balance the problem of squeezing a powerful language into a small space without trimming efficiency, but the high cost of special peripherals still makes it a comparatively expensive language for microcomputer users.

Two new APL terminals have come on the market, coinciding with the adoption of the language by Zilog for its MCZ-1 microcomputer. Anderson Jacobson is selling a dot-matrix printer with an APL character set for £399. The company claims that its A180 is the first APL printer available under £1,000.

Abacus Data Type is offering an APL keyboard which is said to run any APL, having been designed around the definitive IP Sharp timesharing version. It is available for £700, and a printer is soon to be added.

APL was present in strength at Compaq a few weeks ago, with versions on view from MicroAPL and on the MCM micro (used as a pre-processor by RL Systems in its APL work).

Unlike the TIS version from Tekon, which Zilog uses, the MicroAPL Vanguard version runs under the CP/M operating system. MicroAPL is now offering a "teach yourself" course with its products.

There was also a version of the TIS APL in use at the BASF plant at Compac. Although the company has not announced any plans for the language (apart from internal use), BASF's interest is another indication that APL is gaining ground.

THE Unique data collection system from the Data General OEM house DCC International has been made available at the lowest end of the DG range on the DG MicroNova.

Priced at under £1,000, the micro version is aimed at small remote installations which would be able to capture and validate data on site and transmit it to centralised computing facilities.

According to DCCI, the software is completely transportable from single terminal micro systems through the multi-terminal Nova version up to the Eclipse.

The micro version of the data collection system can also communicate in a non-resident batch environment with other mainframes.

Including automatic data validation, the system uses a library of 70 standard routines.

Key elements of the new system are pre-packaged, pre-tested, and ready to install.

The new Distributed Office System brings powerful computing to company-wide business communications.

MEETING CUSTOMER NEEDS. At IBM we've always believed that we should offer a variety of solutions to meet the broad spectrum of our customers' needs.

The IBM Displaywriter, the 5820 and the IBM Distributed Office System are our newest products designed for different word processing requirements.

To find out more, post the coupon or ring Valerie Lindell on Basingstoke (0256) 66144.

This new system comprises software for the IBM 5800 Information System and a compatible host computer. Like the IBM 370 Distributed Office.

The new Diablo 630

Probably the most exciting innovation in daisy wheel printing since the wheel itself.

The Diablo 630 from Zygol is a new generation daisy wheel printer. The first of its type to use either plastic or metalized print wheels interchangeably.

Zygol make type choice easy with over one hundred different Diablo and Xerox print wheels to choose from.

The Diablo 630 provides the user with a single printer to satisfy both word and data processing requirements completely.

The advanced design technology built-in to the 630 has resulted in fewer components, more compact size and quieter running than other daisy wheel printers.

A full range of compatible paper-handling subsystems are available.

And Zygol can specially customize the Diablo 630 to suit your particular requirements. At a price that will suit your requirements, too.

Complete the coupon. And start the wheel turning.

Zygol Dynamics Ltd, Zygol House, Bedford Road, Bicester, Oxon OX6 0XB. Tel: Bicester (0692) 3361. Telex: 657807.

Now IBM goes into extra-terrestrial orbit

WHEN God had created the heavens and the earth He took a rest. IBM allows itself no such naps. On Wednesday it launched two mainframes, the smallest of the 3033 series and the new top range 3801. Not content with this, the company was involved with an extra-terrestrial launch three days later.

The first of three telecommunications satellites was sent up by a company in which IBM has a 42% stake. Meanwhile, back at the launching pad, other 3033X purchase prices were cut by 20%.

Faster

There is something predictable about the amazing deeds of the giant multinational. We have seen, courtesy of IBM, witnessed bright new technological "dawns" when another faster, smaller and incredibly better device is announced and a certain weariness is forgivable.

That said, the 3801 really is faster and smaller than the previous top range IBM kit. Compared to the 3033X processor it is up to 2.1 times faster, it squeezes 750,000 logic circuits into a box measuring four cubic feet and doubles the capacity.

It consumes half the power and basic central storage capacity is 16 megabytes, which can be doubled. There are up to 24 channels, 16 basic and four optional.

Prices start at just over £2 million which buys the 3801 processor, with the 3087 processor controller, the 3087 coolant distribution unit and the 3089 power unit.

Rear right stands the 3081 processor with the large 3082 processor controller in front, which takes over some operational duties. Completing the assembly are the 3800, 3278, 3275, 80CV plus power and cooling units.

IBM has achieved this by a new dyadic processor design, in the process restoring a little-used adjective describing a pair of units treated as one.

The dyadic processor within the 3801 is the marriage of two CPUs so that they share the same central storage and operate under a single control program.

For the operator the dyadic processor will bump up throughput and reduce downtime because if one CPU fails its channel set can be accessed by switching to the other.

IBM calls this "deferred maintenance" and says: "Similar possibilities exist for other functional elements of the 3801 processor unit."

In terms of operating, IBM sources say that it will remain similar. The 3801 operated under System 370 compatible MVS/SP. Performance has been enhanced in two ways: the first 10% throughput improvement claimed with the MVS/SP.

This is enhanced by hardware and microcode functions while the linked CPUs. For Visual Machine users Asset is included as basic.

IBM also claims that the 3801 would not deskill ops. However, the 3082 processor controller promises to do a lot of legwork, it carries out most of the initialisation, disassembles microcode loads, and has hardware error recovery and control over the system console.

For the site where all the main frame kit is bunched into one room, the 3089 power supply is reported to go about its business quietly and not to bellow too loudly in the op's ear.

For the inclusive op with a large magnifying glass, the 3801 has sliding doors instead of a usual swing doors showing a large conduction module, whose effect is to reduce wiring by allowing tighter chip packing.

IBM seems to have done it again.

IBM introduces new ways to improve office productivity.

Sometimes it seems that there just aren't enough seconds in the day to get all your work done.

In an age where technology can move information at electronic speeds, it can still take days to get a finished document into the hands of the people who need it.

But now IBM introduces a wide range of major new office systems and programs. No matter what your business—no matter what its size—these new offerings can help improve your business productivity.

EFFICIENCY FOR TODAY—MODULARITY FOR GROWTH TOMORROW—THE IBM DISPLAYWRITER. This may be the easiest word processing system that you've ever used.

The new IBM Displaywriter can show you how to process words, just follow the instructions on its screen, which guide you, step-by-step, in creating, revising and editing documents.

It can even check your spelling at up to 6,000 words a minute using its electronic dictionary of 80,000 words.

With the communications options you'll be able to send or receive information from other communicating IBM office products, and from non-IBM compatible programmed computers.

And because the IBM Displaywriter is modular, it's flexible. As your company grows in size your Displaywriter system can also grow in size and capability.

So you only buy as much as you need. You may want to design your system initially for one person, then graduate to two or three — by adding more display screens and keyboards, and later perhaps faster printers. Or start with basic word processing and add more software programs as your needs grow. This is why it can be more efficient and more economical.

And although a major design concept was ease of operation perhaps the easiest thing about it is its price. Would you believe from £487* plus software?

DESIGNED FOR THE FAST FLOW OF INFORMATION—THE IBM 5820 ADMINISTRATIVE SYSTEM.

The New IBM 5820 combines many office administration activities with electronic document distribution.

Word Processing—from the same visual display unit secretaries can create, edit, revise, sort, process and distribute business information, as well as handle normal correspondence.

File Processing—with the 5820 you can add, subtract, multiply, divide and compare numeric information within files. It can also perform multi-step tasks with just one instruction.

Electronic Document Distribution—documents can be transmitted in minutes—to a single person, to a distribution list, or a

combination of names and lists—and the 5820 gives confirmation of delivery.

It's easier than you think. For example, special instructions appear on the screen in plain English when help is requested and you can control many different functions from one work station.

In fact, the 5820 can do several things at the same time. As well as the communications activities, many of the traditional word processing revision and pagination functions can, if desired, be carried out by the system automatically, thus leaving the secretary free to undertake other tasks.

The IBM 5820 is an integrated system supporting multiple work stations, all sharing the same information and facilities. And the 5820 can form part of a network exchanging information and documents with other 5820's, suitably programmed System/370 computers as well as the new Displaywriter.

THE NEW DISTRIBUTED OFFICE SYSTEM FOR PROFESSIONAL BUSINESS PEOPLE.

The IBM Distributed Office System boosts productivity in text and data handling by bringing the function and power of central computers to the fingertips of your secretarial, administrative, and professional staff.

This new system comprises software for the IBM 5800 Information System and a compatible host computer. Like the IBM 370 Distributed Office.

The IBM

Developing new tools ahead of the industry

THROUGHOUT this series of articles we have only been able to sketch an overview of computer operations in BP by taking a few examples from each area of the company's operations. Against the background of some of the older, more conventional applications, we have covered some where BP has, in the past, been prepared to innovate in the computer area.

Where BP uses leading edge technology it is mostly on an experimental basis, and the company points out that most of its non-experimental computer use is merely in the sensible application of proven new technology. Without doubt, BP was one of the first major oil companies to make extensive use of linear programming techniques, and the current expertise that exists within the company enables extremely large models to be developed.

Strategy

One recent solution package produced to solve modelling problems utilises in the order of 1½ megawords of central memory while some LP programs require in excess of 10 hours' computer time even on the latest upgraded Univac 1100/82 configurations. It is techniques such as these that enable BP to organise its entire supply, demand and operational strategy worldwide.

Corporate planners are large users of linear programming within the BP group. Their role is to forecast future activities generally and to analyse new options in re-

fining and marketing strategy. For longer-term strategic planning, BP sees LP-based models as the only way, at present, to obtain an overview of its complex trading, marketing and distribution patterns.

BP's more conventional use of non-LP financial models is currently undergoing a re-think with changing planning attitudes. The effects of international uncertainty these days are so variable that in-depth modelling for long-term strategy becomes too complex. The approach, therefore, will be to use financial modelling packages for slightly shorter-term planning against individual profit centre areas. Longer-term strategies may be based on the use of new computer techniques.

For such systems, corporate planners see no reason why they should not opt for desk-top dedicated systems with user-oriented languages which enable each strategic analyst to be able to alter and redefine the system or parts of the system within the constraints agreed with other corporate planners. Such techniques require systems that enable flexible manipulation of text as well as data. Thus, while in the short term BP is testing interactive financial planning systems such as Execucom, Total and Rapport, the longer term requirements may see the use of "expert" systems.

Corporate planners, within their individual disciplines, will also require private user files for analysing and manipulating information which can later be input into an

overall corporate planning model. For departments that are relatively small in terms of numbers such dedicated systems will probably use some form of ring system, and the computer systems support group in corporate planning are already studying a variety of ring-based office systems.

There are some areas where BP is prepared to develop new software tools ahead of the computer industry itself in order to make its own users' future life a lot easier. BP Trading's computer services department has, for example, developed a suite of programs which form the basis of a new programming system which can be used by any other system either in batch or transaction mode.

Definition

PRESS (Parameterised Report, Sort and Selection System) is a total system involving the use of a data dictionary for the development of programs which can be defined by short parameter sets.

BP says that PRESS is particularly suitable for information retrieval, report formatting (including word processing), automatic validation using pre-defined data dictionary conditions, and calculations involving immediately input variables matched against stored data.

BP Oil's computer division, which was originally involved in the development of the Iris high-level programming language in the late '60s, has for the last few years

The first three articles in this series dealt with BP's use of conventional computer systems. In this final part, a look is taken at innovative uses of computing within the BP Group.

been developing a new, ultra-high-level programming language called LPS (Logical Programming Syntax). BP says the language is a unique development and involves the sort of investment which is normally reserved for computer manufacturers themselves. It feels that LPS is probably ahead of anything currently available from the computer industry.

Conventional high-level languages in current use usually require a programmer to define precisely each stage of the process of manipulation of data. The exact manner in which the data must be manipulated must also be specified according to the language, in order to give the precise results required by a systems specification.

BP Oil's LPS departs fundamentally from this philosophy and enables the user to define what he requires, without recourse to the usually accepted conventions. It allows the computer itself to deduce the step-by-step logic that is required. In other words, a program can be developed using formalised statements in non-procedural terms.

LPS is proving to be a powerful tool for users of systems rather than applications programmers. It is also, says the company, extremely powerful in the hands of specialist programmers, and the experiments conducted so far seem to suggest an economy, in lines of coded statements, of up to 60%.

But this won't be the first time that BP has been ahead of computer manufacturers, it claims. Take the case of Unilab, (based on the NCC Filetab package) of which the original development was sponsored by BP Trading over seven years ago in conjunction with the NCC.

Unilab is a batch oriented interpreter of decision table based parameters, consisting of a single skeleton program incorporating all the logic necessary to process one file for one report. A parameter is added to the skeleton for detailed requirements such as file and record definitions, processing logic, sort and output formatting/editing. Further parameters extend the capabilities beyond those of a normal report generator. Written in Assembler, it incorpo-

Electronic office planned for HQ

BP From page 16

rates dictionary naming of data items for legibility and portability. Unilab was adopted as the Univac version of Filetab.

BP Trading's computer services department has also had close involvement for a number of years with Michael Jackson on structured programming techniques, and structured programming is now applied as a standard training course on structured programming using the Jackson method.

Some areas of operations, such as the North Sea, demand the most advanced methods possible to ensure maximum efficiency and safety. For example, where land lines cannot be laid for normal communication, microwaves can be used to carry computer data.

Most oil platforms, however, such as in BP's Forties Field in the North Sea, are out of sight of land and too far away for conventional microwave links to be utilised. BP has overcome this by using tropospheric scattering which bounces microwaves off the earth's lower atmosphere.

BP's four platforms in the Forties Field are each equipped with an ICL 7502 terminal and a printer. The four platforms are all inter-linked using line-of-sight radio links carrying computer data which is co-ordinated at either one of two of the platforms and then further transmitted using the tropospheric technique to the BP control centre at Dyce in the North of Scotland.

The Dyce centre utilises an ICL 2904, and one of the most important systems is that which is used to analyse and monitor stores requirements for the platforms.

Research

The system enables online updating of files on each platform's stock records automatically from the data input from the platforms. With the tropospheric scatter system, corrupted data is overcome by using parity checks against each character in the transmitted message. Introduction of the system has considerably improved the logistics of running stores on these multiple platforms.

BP Petroleum Development's Dyce centre is currently funding some of the work being carried out at Edinburgh University's Machine Intelligence Research Unit on the "expert" systems. An expert system is currently being devised to run on a PDP-11/34 to provide a knowledge-based system for the operation of oil platforms.

This is one example of BP's many areas of involvement in the utilisation of new technology. While some of these applications may at this stage be viewed by BP as experimental, it has certainly not overlooked the need to use the latest technology as early as possible at all commercial levels in the company.

BP Chemicals has already restructured its services operations to plan and co-ordinate both data processing and information processing activities with office automation procedures, and management structures have been designed to cope with the changes.

The recognition of the interaction of the various applications of microelectronics, not only within each BP company, but in the group as a whole, is a new management function that has been set up to be known as Information Systems Administration. This is a head office corporate level activity, the aim of which is to co-ordinate all information processing strategies (including telecommunications) throughout BP.

While the company does not see any particular need for a dedicated hardware or systems

in use, the early use of new technology has already been carefully considered. The complexities in planning information communications networks, for an organisation the size of BP, are immense. The first principle, therefore, is the establishment of information network protocols.

BP has already narrowed its communications options down to about four serious possibilities for a UK network architecture which will probably make extensive use of distributed processing and be based on a ring-type communications system. The company is evaluating systems such as IBM's SNA and the forthcoming Univac DCA network architecture. BP has also had discussions with British Telecom on System X, and is constantly monitoring all other international PTT network developments.

New office units, such as BP's new headquarters building which it intends to move into next year, and new buildings at the Research Centre in Sunbury, are all being fitted with ducting to allow total electronic office use. In such advance planning, even fibre optics have been considered and BP Oil is currently installing fibre optic links in its headquarters.

Many areas of information technology organisation and implementation are being considered. The Research Centre Library, for example, currently contains some 11 million records—thus a large information retrieval system combining the latest IR techniques as well as microfilm will need to be developed, together with associated communication for appropriate users throughout BP.

As yet, no specific decision has been made on any standard form of office automated systems, but most options being considered, or in a few instances used by some departments within BP companies, tend to favour ring systems. As far as any specific ring system is concerned, BP could opt for a number of possibilities.

Scicon, for example, is investigating Demos technology. In a joint venture currently undergoing trials at the National Physical Laboratory, using Intel 8086 multiple processor configurations programmed in Pascal, a range of different architecture possibilities based on the Demos high-speed ring technique is being studied.

This method has significant potential, particularly in the area of automation, and could be one area where BP might well use ring systems, the implementation being relatively smooth as Scicon already has its own facilities to burn programs on to chips.

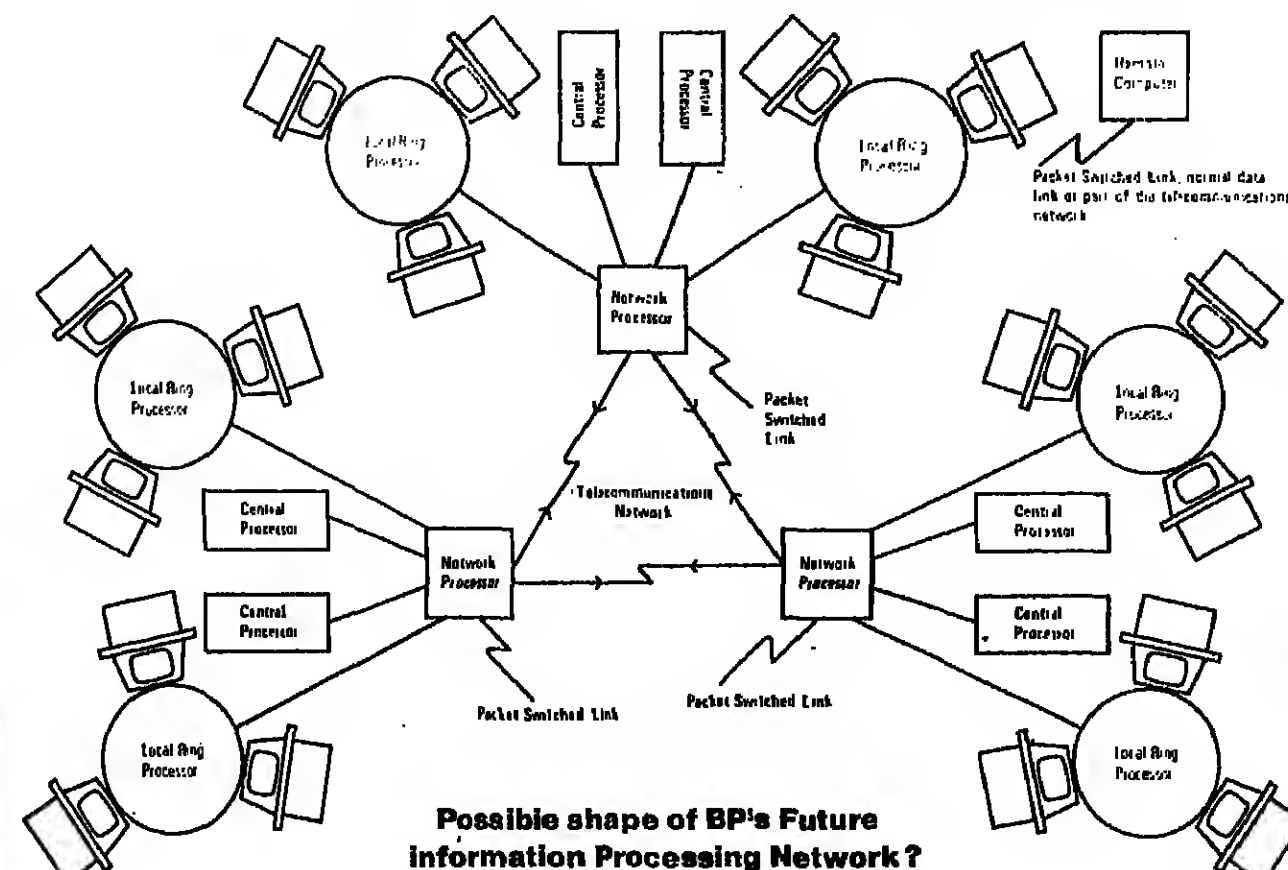

The first real significant move within BP, as far as electronic office and ring systems are concerned, is at BP Oil in Hemel Hempstead which, this month, implements on an experimental basis one of the first Xionics integrated data management networks.

First step

It will use 18 terminals and is the first step towards a complete automation system, a total system leading to a number of "paperless offices". The system will handle everything from electronic mail to diaries, data and word communications.

Xionics believes that its system will be suitable for use on an international scale by multinational companies. The technique uses two parallel rings called Xibuses which enable up to 4,000 international sites to be served. The system, itself, called Xibus, is operated through the Xinet. The Xibus uses special and general purpose processors.

The Xibus system, which includes Winchester disc drives, controls a number of multi-function VDUs which are linked via one or more Xibuses operating at one megabyte a second. The Xibus makes extensive use of parallel processing and has a minimum data transfer rate of 100 million instructions per second.

Possible shape of BP's future information processing network?

We'll get your up's going.

Starplex development system

will get your up's up and running every time you use the 8048/49/50, Z80, 8080/8085 or our new NSC 800, 8070/72/73 series.

Starplex, the latest development system! Practical, compact styling. Complete hard and software. Configuration with Display, Memory and Printer. In-System-Emulator for supporting devices mentioned microprocessors (universal application). Modular construction. Efficient, efficient, efficient concept. Proven technology, therefore highly reliable standard modules of National's single board computer program. Excellent price/performance.

MODUS

IMS Systems and Software

Distributed db/dc systems — complete installation update.

Surrey to c. £12,000 + Benefits

A well known and highly respected International Bank has embarked on a massive redesign of all the UK and European systems, so that by the mid-eighties they will all be IMS db/dc based. Naturally, new hardware is to be installed and the whole computing facility updated and updated.

The lack of specific IMS db/dc expertise, however, has caused a number of different new positions to be created — ranging from IMS/COBOL Programmers to Project Leader and Software Systems Programmer positions. In each case, in-depth knowledge and experience is expected and must be combined with the ability to put ideas across effectively and fluently.

First-rate benefits include a subsidised mortgage scheme.

Project Leaders/Consultants

Running project teams designing and implementing turnkey systems.

Buckinghamshire to c. £10,500

Two newly created positions for Project Leaders are currently available with this growing and developing software house in Central Bucks. Candidates must already have experience of running projects and teams to tight time schedules, although not necessarily in a software house environment. Additional management experience of setting and defining budgets would naturally be of value, although not mandatory.

Technical expertise required is fairly non-specific although should cover on-line or real-time systems and use of high level languages on minis. Naturally, extensive analysis and design experience is required and applicants must be able to demonstrate a flair for dealing with users or clients.

'Distributed Systems' Analyst

Producing designs for a country-wide system.

London E.1. to c. £10,500 + BONUS

One of the best known service and manufacturing companies in the UK are in the process of building a fairly large mini-based distributed system on which a complex and comprehensive sales order processing system is to be implemented.

The current requirement is for an experienced Analyst to join the design team, in a "Business Analyst" role, to contribute significantly to producing the systems design. The expertise the company lacks at present is in the Sales Order Processing field, so candidates must have completed the design of at least one similar system. Obviously, additional knowledge of minis and/or distributed systems is essential to the job.

Relocation and other large company benefits available.

Field Engineers

Find out how your career prospects can be enhanced.

London & South c. £8,000 + package

Modus has been inundated with requests by several major organisations to recruit experienced Customer and Field Service Engineers. The need to provide reliable and self-starting front line engineers has also been recognised by smaller and growing companies and some superb opportunities exist in this type of environment.

Primarily, we are seeking trained and experienced computer level technicians who can be relied upon to diagnose and rapidly provide a solution to hardware problems. An ability to devise and use diagnostic software would be a bonus.

Modus is keen to hear from any engineers who believe they can contribute to our client's needs, and a full discussion is welcomed. Most requirements are in London, Home Counties and Southern locations.

Consultants: — Mike Croxall or Andy Wright

If the advertised positions do not match your experience or aspirations, Mike and Andy are always available for a confidential discussion of the possibilities. An informal meeting — often an essential part of the process — can be quickly arranged.

International Personnel Consultants

Modus Management Services Limited

148 Watling Street, Radlett, Herts. WD7 7JH

Telephone: Radlett (09276) 3077

Micro-Software Designers

A growing number of interesting and varied projects.

Germany - Europe £18,000 to £25,000

Modus has been exclusively retained to recruit a number of experienced micro-software designers for projects in West Germany, Belgium and Holland. Preference will be given to applicants who also have a background of software or technical systems design experience on mini-computers.

A thorough knowledge of the Intel 8080 range of software and hardware is essential, including MOS usage, CHILL, ASSEMBLER plus high level languages such as PL/M, PASCAL or BCPL are likely to ensure definite interest from our client. All projects will extend for at least 12 months with every chance of extension or alternative consultancy work subsequently.

Some kind of tertiary qualification is very desirable (HNC minimum) but experience and competence of micro design technology is paramount.

Fortran Compiler Expert

To design and produce a new Fortran compiler.

S. Germany £20,000 to £25,000 min.

Our client is a small, specialist, wholly German based software house which numbers among its customers, the largest and most prestigious European computer manufacturers.

The company currently has an urgent requirement for a FORTRAN compiler designer to join their ranks, to build and implement a new compiler. Naturally, extensive experience of compiler design and of FORTRAN are the primary criteria, whilst a thorough knowledge of optimisation techniques completes the picture of an ideal candidate.

Considerable help with relocation is given and the salary on offer is highly attractive even by German standards, especially when the current exchange rate is taken into account.

CICS Support Programmer

Advising project teams on CICS systems design.

Hertfordshire £8,000 to £9,000

This is an ideal opportunity for a young programmer with 2-4 years experience of CICS systems, to utilise such expertise in helping an installation convert all development to CICS-OL/I. Obviously OL/I database experience would also be of value, as would knowledge of COBOL and JSP techniques, although experience of any formal structured programming will suffice.

The company runs two 370's under OOS, one of which is shortly to be replaced by a 4341 and the other kept purely for development work — both with DOS/VSE.

Promotion prospects are superb — especially since this is a unique, new position — with the next step up automatically meriting a company car. All usual large company benefits, including BUPA-like medical cover.

Australia

A service for committed emigrants to Victoria or NSW.

Call us for direct contact with a leading consultancy in the Data Processing marketplace for all levels of staff in permanent career orientated positions. We are primarily interested in Programmers, Analysts, Project Leaders/Managers, Customer Service Engineers, and Sales Personnel. Note that we do have definite requirements from some of the leading companies in Victoria/NSW and applicants will be advised accordingly — this particularly applies to Customer Engineers with Univac or Honeywell experience.

Modus will provide advice and offers personal administration of your introduction to a choice of jobs in Australia, commencing with an interview with one of our consultants. We can also advise on the logistics of moving to Australia.

MIDDLE EAST BUSINESS SYSTEMS ANALYSTS £17,500-£22,000

Have you considered spending a period in the Middle East? This could make a dramatic improvement in your finances, and at the same time widen your experience in an IBM mainframe environment.

Acting for clients, a major international oil company, we seek systems analysts with:

- from six to eight years' analysis experience, including feasibility studies and/or systems engineers.
- degree in business administration, computer science, engineering or equivalent.
- ideally but not necessarily — knowledge of Inquire, Mark IV or other high level query language.
- ability to communicate effectively both orally and in writing.
- good problem-solving skills relating to computerised commercial/industrial applications.

The applications are complex, including accounting, performance indices, auditing, inventory control and order tracking. Employment is on an indefinite term basis and provides real career opportunities. Benefits include air-conditioned accommodation, excellent sporting and recreational facilities, and free medical care. The posts are initially bachelor status, but generous leave arrangements for married employees provide free flights home for interim vacations during employment.

Salaries quoted are net of deductions and include various allowances. There are no restrictions on transferring earnings overseas.

Please ring us for a discussion and an exchange of information, quoting reference 283, Telephone calls after hours will be recorded.

Career opportunities in

COMPUTER ENGINEERING

with the largest DEC-based time sharing network in Europe and North America.

Based on the computing power of 26 dual-processor DECsystem 10's we market a time sharing service in all of the major business centres in America and Europe. A new extension of this service, ADP/ONSITE, puts a software compatible 30 hit processor on client sites, whilst retaining all of the network benefits.

COMPUTER ENGINEERS

£7,000 to £11,000 + car or car allowance

We have site and field service positions available. We look for engineers capable of chip level repair of large memories, 200 mbyte disks, 6250 bpi tapes and a cross section of CPUs. You will join one of our teams and be trained to work in an environment where results count.

All positions carry BUPA, contributory pension scheme, etc. Telephone 01-637 1355 and ask for BILL TAYLOR or JOHN ROLFE to discuss these vacancies in detail, or write to us at:

ADP Network Services Ltd,
179-183 Great Portland Street, London W1N 6TB

Major Micro Development Programme

We are an expanding division of a major Group based in Hampshire. We are about to embark on a number of significant developments in the areas of micro control and surveillance, using a range of micro computers including the INTEL 8086, we also construct simulators based on DEC PDP 11's used for training.

We require programmers with 3-4 years experience for the engineering posts and in excess of 5 years experience for the Senior position. Fluency in CORAL 66 is preferred, but experience of process control and real-time systems in a Defence or Aerospace environment would be acceptable.

We are entering an exciting phase in our Company's development which will afford both interest and career opportunities. We are offering an attractive relocation package to this area of the South Coast providing an attractive blend of amenities.

Nobody develops a taste for champagne by crying into their beer!

“

- The economy is getting blacker
- Christmas is looming nearer
- high interest rates
- rising unemployment
- future career looking bleak – sounds familiar?

Not at Marcol

I believe this country still has the best talent in the computer industry. British analysts and programmers are some of the shrewdest, sharpest thinkers I've ever met – and I should know, I work with them.

Marcol employs over 200 men and women who work in teams on projects which are the envy of the competition whether in the UK or Europe.

The people who work for us are rich – not just in high income and profit sharing partnership terms but also in job satisfaction and career opportunities. That intellectual commitment has helped turn Marcol into one of the country's most aggressive and successful software companies – indeed we are one of the top 5 independents.

Right now, I'd like to find more people like them – people who wish to share in our future. The opportunities within Marcol for the 80's will brighten up the holidays for you and will give you the optimism and enthusiasm I feel.

We're looking for a wide range of people from junior programmers to senior executives, salaries from £6,000 to £18,000. So, if you have 2½ years or more DP experience, would like to talk about your future and perhaps celebrate your Christmas with champagne and not beer – telephone Penny Bailey, our Resources Manager – and whet your appetite for success. ”

Application Software Sales

London, Scotland, S.W. England earnings £16,000 + car

A company whose software applications products have enabled them to establish an enviable reputation throughout the U.K. seek further marketing representatives to the above areas.

Applicants should have U.K. Sales experience but those currently occupying related positions will receive serious consideration. The successful candidates must have the ability to deal with client personnel at all levels and will possess a steady and dependable attitude towards maintaining sales performance. Effective formal training is available as appropriate. Excellent incentives supplement a high basic salary.

Contact: Mike Galtkell

Sales Executive

U.K. Earnings c. £15,000 + car

Following the successful launch of a new and innovative training service an established computer services organisation is seeking an additional Sales Executive. The service is available throughout the U.K. via an established U.K. network and is based on a software product with powerful conversational and graphical capabilities.

Applicants aged 30-40 years should have a professional attitude with a proven sales track record of at least 3 years. A knowledge of the "training scene" would be very desirable but the drive and ability to sell effectively in all levels is much more important.

Contact: Bev Stevens

Programmers and Analysts

Bristol

A world famous advanced engineering company is seeking analysts and programmers for their commercial systems development department.

Senior Programmers to £6,600 Jan. 1st Review
With 3 or more years experience in commercial applications using COBOL preferably on IBM hardware. Leadership and good communication skills are vital.

Systems Analysts to £7,300 Jan. 1st Review
Three Systems Analysts, preferably degree or equivalent level and with either commercial programming or analysis experience. Self-starters, capable of maintaining a high level of user liaison, and dedicated to seeing systems through from inception to implementation.

Contact: Bob Male

Systems Software Opening

Nottingham & Depending on Experience

An opportunity exists for experienced applications programmers or systems programmers to move into the system software field. The organisation which is well known and highly respected has a large IBM mainframe installation running under MVS.

Applicants should have a good educational background and at least 2 years programming experience, combined with a sound knowledge of IBM Assembler.

Contact: Bev Stevens

Senior Systems Analysts

N.W. Birmingham To £8,500

The Computer Services Centre of a large manufacturing organisation requires additional Systems Analysts at a senior level to work on a range of commercial and manufacturing systems. Data Base and On-line applications are being developed and the successful applicants will be closely involved with users in the design and introduction of systems appropriate to them.

In addition to sound business systems analysis experience a COBOL programming background is required and an understanding of JCL operating systems.

Contact: Peter Bowen

Senior Systems Analyst

Borehamwood c. £8,000

A sound business systems analyst or analyst/programmer is required by our client. Commercial experience and the ability to handle a wide range of on-line applications with close customer liaison are other essential features of this vacancy which could lead to Project Leadership given appropriate levels of experience.

Specific hardware background is not important although familiarity with IBM management systems would be useful. The company offers excellent prospects for an enthusiastic and go-ahead person.

Contact: Peter Bowen

Programmers

Birmingham To £7,000

This city centre IBM installation is looking for COBOL programmers with a minimum of two years experience. Applications will be varied but will include Teleprocessing and On-Line systems. A knowledge of IMS, MVS, TSO or SPM will be advantageous. Promotion prospects are self-determined within this secure environment.

MYRIAD

DEC PDP 11 SYSTEMS SOFTWARE

TOTAL — the most successful independent database management system ever produced, a system which operates on 28 different computers under 40 separate operating systems, has well over four-thousand established users and is designed to promote distributed processing.

The tremendous success of Cincom's product range has now created a demand for additional personnel to work on either development or support of the DEC PDP 11 and VAX products.

For each of these positions a sound background in DEC software is necessary, including experience of MACRO-11 and either RSTS/RT11 or RSX11-M. Immediate terms of employment are extremely good and long-term career prospects are bright. The company is successful and these are excellent opportunities for you to contribute to, and share in, that success. Telephone Myriad on 01-353 0981 now, to discuss your future with Cincom, or write quoting reference SW3/2711/CW.

SYSTEMS ANALYST

LONDON

£8,000 to £11,000

An outstanding opportunity exists for a Systems Analyst to join the development group of a highly successful international organisation, with its headquarters located in Central London.

The group is responsible for the development of an interesting and varied range of new systems for the investment trusts and bonds aspect of the company's operations throughout the U.K. and Europe, providing vital business information to more than 180 users. An extensive communications network links the users, facilitating rapid interchange of information and providing each location with remote processing facilities.

This is a first-class opportunity for Analysts seeking a career move to gain valuable experience together with the opportunity for project leadership in a dynamic organisation.

Prospects for future career progression are excellent providing scope for individual development, and our client envisages a high starting salary together with excellent fringe benefits.

REF: E1/2711

Maidenhead

PRODUCT SPECIALIST c. £11,000 + Car
You will become a specialist on the application of Cincom software products to the mini-computer market. This will involve both pre- and post-sales support activities including the presentation of products to prospects and overall systems consultancy. This is a senior position for which you will need to offer around FIVE YEARS' experience of mini-computer systems including a DETAILED TECHNICAL KNOWLEDGE of DEC PDP 11 software.

SOFTWARE DESIGNER c. £11,000 (+ Car)
Offering at least FIVE YEARS' RELEVANT MINI-COMPUTER SOFTWARE EXPERIENCE you will become involved in the development of Cincom's products for the DEC range of hardware. A high commencing salary is available and you will be eligible for a company car after a short period.

TECHNICAL SUPPORT PROGRAMMER c. £9,000 (+ Car)
This involves providing detailed technical assistance to established users. TWO YEARS' or more sound MACRO-11 experience is required and you will be eligible for a company car once the initial training is complete.

A PROGRAMMER

LONDON, W.6

To £7,500

This is something different; an opportunity for a young programmer with a real interest in computing to escape from the routine of project development in a large team and join a small group providing a range of computer services and support to users.

The company is a major petro-chemical and energy resource engineering organisation which has an impressive record of growth and success throughout its history. That success is continuing today and as a result demands on the computer services department are very high. Large IBM and Univac mainframes are used for major systems but a range of smaller computers for specialised applications are also used.

The person appointed will ideally have some experience of COBOL and/or Univac 1100 systems and will provide diverse support services to users as well as developing small systems from inception to implementation. This is an unusual position which offers excellent personal progression, good conditions of employment and provides every opportunity for career development.

REF: SW2/2711/CW

MYRIAD APPOINTMENTS LIMITED

30 Fleet Street London EC4Y 1AA Telephone 01-353 0981 24 hours

MYRIAD

SENIOR APPOINTMENTS IN INFORMATION SERVICES WEST LONDON

On behalf of a major American construction engineering company we are seeking two senior people to fill key roles within the U.K. Information Services Group.

INTERNAL MIS CONSULTANT: TO £13,500

The person appointed to this position will be responsible for optimising existing computer facilities and for promoting the use of computer and information resources throughout the company. This will include the assessment of new technologies as they become available. A wide variety of applications are currently in use, based on large Univac and IBM mainframes, IBM and ICL mid-range computers, Harris and Redifon small systems. The ability to appreciate computer developments in the broadest sense and to communicate with very senior user management is imperative. Experience of an engineering company environment will be advantageous.

Despite the world recession this organisation has remained particularly successful and is able to offer genuine career progression at management levels to the successful candidates. A high commencing salary is offered and benefits include free life assurance, interest free season-ticket loan and relocation assistance. Write quoting reference SW1/2711/CW, or telephone the number below to discuss these positions in detail.

MYRIAD APPOINTMENTS LIMITED
30 Fleet Street London EC4Y 1AA Telephone 01-353 0981 24 hours

PROJECT CO-ORDINATOR: TO £11,000 (NEG.)

This person will be responsible for the co-ordination of local computing at project sites in the U.K., the Middle East, Far East and North Africa. Hardware used includes IBM System 34, System 38 and ICL 2903/4, running a full range of project control applications. The successful candidate will offer experience in business planning, project scheduling and control and, ideally, a technical background relevant to the hardware in use. He/she will hold managerial responsibility for a small team of Analyst/Programmers and must display the ability to communicate and liaise effectively with all levels of user management.

JOBS WITHOUT PEER IN A TOWN WITH TWO PIERS

With the ever changing technology in the telecommunication field, we at ITT Creed Limited, part of ITT Business Systems Group, want to expand our Software Department, which will be embarking on a new project early in 1981.

As a result, there is a need for EXPERIENCED SOFTWARE SYSTEMS DESIGNERS to join our team at the design stage of the project. It is your chance to be in at its birth and work through to a position of team leader during the implementing and testing phases of the product. One of these senior people will be based towards the quality control and testing aspects of the project.

If you have had several years' experience in Software Systems Design and have specific knowledge in any of the following, we would like to hear from you:

- embedded operating systems
- text editing or word processing type applications
- communications, line handling, networking protocols
- software development for Microprocessor target HW

Our development facilities are based around a PDP11/70 running the UNIX operating system.

These positions may involve some international travel to liaise with our sister company. You will receive a competitive salary and the prospects for a talented designer are very bright. Some of the many benefits offered include 25 days holiday and a generous relocation package. If it is necessary to move to the Brighton area, which in itself is a bonus.

Please send full career details to Mr. Ray Hooker, ITT Creed Limited, Crowhurst Road, Hollingbury Industrial Estate, Brighton, Sussex, or telephone Brighton (0273) 507111 Ext. 3514 for an application form. (Answering service after office hours is available).

ITT Creed Limited

JBA

System 34 Specialist

Surrey £10,000 +
Only very occasionally does an opportunity arise to join a world wide organisation and take control of their U.K. installation, from operations through to the development of systems.

This position calls for a combination of organisational and technical abilities and a substantial degree of self motivation. In a position of wide responsibility.

Background must consist of extensive IBM system 34 experience encompassing operational and RPGII programming skills also the development and installation of manufacturing modules and systems. Practical knowledge of MAPPS is desirable. Prospects are exceptional and opportunities will exist to develop a career within a world wide manufacturing corporation.

Contact: Janet Chilvers

Honeywell Level 6

West of London to £12,000 + car

Experienced PROJECT LEADERS are urgently required by this small but rapidly expanding systems house to control newly forming teams and to handle projects from feasibility through to on-site implementation.

Current applications cover the financial, production and commercial system areas with the client base being around London, making mobility and self motivation pay requisites. Specialist knowledge must cover 11 level 6 minis under TFS, GOS, MUI 200 or BUI and COBOL in a real time, customer contact environment. Sound design and analysis skills plus knowledge of SCREENWRITE are equally important.

Excellent package offered plus relocation to the right applicants.

Contact: Brian Postle

Design Consultants

London c. £12,000

A well established consultancy organisation is planning a major expansion in their Videotex systems activities and therefore have opportunities for Senior Consultants to join the team.

Candidates should ideally be graduates with a minimum of 10 years in computing - at least three of those spent recently in communications/packet switching. Knowledge of X25 a distinct advantage.

Ability to work with clients, analyse their requirements and relate these to Videotex as well as design new systems/networks of systems, or enhancements to existing systems, is essential. Opportunities for international travel.

Contact: Jim Baker

Marketing Consultant

West London up to £12,000 + car + European travel

We have been retained by a leading marketing organisation to recruit a senior consultant who will be responsible for investigating and reporting on the marketing activities of the data processing industry in Western Europe.

Candidates must have a minimum of five years experience in data processing preferably with knowledge of IBM products.

Contact: Isabel Bruce

Project Leader

City to £11,500

Our Client, a world wide insurance organisation, wishes to recruit a senior computer professional capable of taking full responsibility for specific projects.

Candidates must have had at least five years in systems analysis, including considerable experience of large systems, from feasibility through to implementation. A background of project management and the ability to deal with users at all levels is essential. A degree or professional qualification, coupled with a knowledge of database techniques and terminal based systems would be a definite advantage.

Contact: Isabel Bruce

Systems Analysts - Insurance Systems

Rural Hampshire to £9,500 + Mortg. Sub. etc.

A large and expanding insurance Company are seeking additional Systems Analysts to strengthen project teams involved in exciting design and development work.

Current configuration includes Redifon mini and Burroughs B6800 mainframe. Incorporating batch systems and on-line testing facilities.

A business systems involvement, including 2 years systems analysis and experience of COBOL, are the main qualities sought.

An excellent benefits package includes mortgage subsidy, generous relocation expenses, low interest loans, plus others.

Contact: Brian Postle

Analyst/Programmers Senior Analyst

London c. £9,000 c. £10,000

A leading clothing manufacturing Company based in North London are looking for computer professionals in maintain and develop their HP3000 and IBM 370/138 machines.

Applicants must have at least 3 years experience in data processing and have a good knowledge of the HP3000 using COBOL. An exposure in databases is an added advantage. A sophisticated real-time system is incorporated, so an understanding of this technology is desirable.

Excellent salary and fringe benefits offered.

Contact: David Hendry

Analyst/Programmers

Middlesex up to £10,000

Our Client, a leading computer systems consultancy are looking for an Analyst/Programmer with a minimum of one years experience in a commercial DP environment using small interactive computers, programming in a high level language.

The successful applicants will be required to liaise with clients during specification, development and installation and to provide on-going support for further systems development.

Good salary plus excellent career progression is offered.

To complement the above position they also require a Senior Analyst/Programmer who, coupled with above should also have been involved in the design of one major system from requirements study through to implementation.

Ideally, candidates should have project leader and technical sides support experience, but this is not essential. An awareness of current hardware technology and trends is also desirable.

Recruitment Consultant Looking for a change?

If you are a successful recruitment consultant with a desire to develop some of your own ideas, earn more money, be part of a smaller growing company, or for some other reason wish to make a change, contact me to talk over the possibilities.

Real-Time Technical Programmers

Expanding, successful companies.

Minicomputers	Surrey	to £10,000
Minis/Micros	Herts/Beds	to £10,000
Microconsultancy	Berks	to £10,000

Several clients have requirements due to continued expansion. Technical systems programmers at various levels from 1 to 5 or more years experience should apply.

Software Manager

Northern Home £14,000
Counties + prestige company car

Wide scope of development assignments, opportunity to build and develop your own group, encouragement to innovate with new ideas, is this for you? If you have proven systems software experience, have managed a technical team and can demonstrate an enthusiastic approach, I suggest you make an early application.

Software & Hardware Design Engineers

Successful International Engineering Company
North London to £9,000

Programmers with PDP11 and/or M6800/6809 assembler level programming experience.

Engineers with digital and analogue design experience. Several vacancies exist in a number of different project teams working on graphic arts and print control systems.

Computer Support Specialists

Software and Hardware
Attractive location to £11,000

Our client is seeking two experienced computer specialists to provide installation support at sophisticated computer communications sites in the U.K. The software specialist will have wide telecommunications knowledge, the hardware specialist will have wide peripheral and CPU experience including telecommunications. Extensive overseas product training given.

Apply in confidence to Terry Harvey by sending personal and career details, or contact him for an application form, evenings Gt. Musenden (02406) 4705 or daytime as below.

Looking to expand
your horizons?...

Our clients are looking for an enterprising

Fortran Programmer/Analyst

who wishes to advance his/her core of technical competence while getting more deeply involved in the sharp and of computer-aided problem solving.

The position is within the Project Finance Division of a

City Based International Merchant Bank

which advises and assists clients throughout the world on the financing of major capital projects.

They will pay

£8000

plus generous benefits
including mortgage subsidy

for the right mixture of experience, ability and potential.

The applications are in state-of-the-art

Financial Analysis

encompassing, among other things, financial modelling, discounted cash-flow methods, and Monte Carlo simulation, applied to the financial evaluation of projects.

If you are in your twenties, probably a graduate, with a sound knowledge of Fortran, and a strong desire to put this experience, and your native intelligence, to profitable use; if you are numerate, articulate and keen to learn; if you are capable of thoughtful and creative analysis in developing systems, and quick on your feet in using them; and if you would like an interesting and challenging job with excellent career prospects,

Then

apply soon, with a resume of your career and experience to date, stating the name of any organisations to whom you would not like your application to be forwarded, to:

J. D. Vine, Account Director (Ref: CRS/188)

THE INDUSTRY'S WIDEST READ AND MOST REQUESTED NEWSPAPER

Recruitment

In Informatics

Jnr. Applications Progs.

Rhineland Germany: Salary £16K

A German Chemical and Pharmaceutical Company has requested LOGISTIX to identify and recruit Applications Programmers and Analyst/Programmers for its recently upgraded IBM installations. The Company is situated in an area of outstanding natural beauty and within three hours' drive of six neighbouring countries. It is essential that all applicants have a minimum of 2 years' COBOL Assembler or PL-1 programming experience although the hardware

involvement is irrelevant, since excellent in-house training and manufacturers' courses will be provided. The Company is planning to implement an SNA network during the next 2 years and you will therefore be daily involved in development work. These positions represent an outstanding opportunity for career-minded professionals aged 23-28 years to enhance their technical skills whilst simultaneously enjoying the diverse cultural benefits of another society. Ref. L/48/A

Operating Systems Specialists

Herts: Salary to £11K

Systems Programmers and Software Development Engineers are required to join a recently formed project team to develop and support a new operating system. Both positions demand previous software experience in the area of compiler development, data communications and systems generation. A proportion of the work function involves supporting both existing and new clients in the installation and tuning of new software releases. Con-

sequently, our client will seek a degree of personal communication skills in all respondents. Whilst these positions carry either a car or car allowance, it is expected that successful candidates will enjoy - indeed thrive upon - both national and international travel. These positions represent an outstanding opportunity to join a Company whose products are in great demand and therefore early promotion is a distinct possibility. Ref. L/48/B

ICL Applications - Canada

Full Contract Package

We are seeking several Programmers and Analyst/Programmers for 6 months' renewable contract positions in several Canadian Provinces (not East Coast locations). The required programming skills are: ICL 2000-S or ME29 COBOL with either MTS or IDMS software experience. The applications are inventory/stock control and order entry

processing. Previous programming development in these areas is an obvious asset. In addition to an excellent contract rate, accommodation and travelling expenses will be paid. Initial interviews will be held within seven days of the appearance of this advertisement. Late 1980/early 1981 start dates are envisaged. Ref. L/48/C

Pascal & ADA

Thames Valley & London: Salary to £11K

Pascal and ADA have a great future. If you want to participate in the realisation of their commercial potential, please read on... Our client, an expanding Software/Systems Supplier is based on the edge of The Chilterns in an area of outstanding natural beauty. Current requirements are for Program Engineers and Software Designers who can offer a combination of academic

achievement and practical exposure to both software and hardware oriented projects. Suitable candidates should have a real demonstrable interest in PASCAL compiler development or have participated as a team member in the evaluation of ADA and similar hybrid languages. Interviews will be held in early December and offers made seven days thereafter. Ref. L/48/D

Communications Software

W. Germany: Pkg. to £18K

An established world leader in telecommunications products is seeking to recruit Communications Software Specialists to join existing project teams at its R & D Headquarters in Southern Germany. At least two years' experience in the design and development of specialised software for PBX or PAAX systems is essential. Applicants who are

also able to demonstrate a knowledge of digital hardware concepts will be particularly welcome, as will those with experience of programming around Intel 8085/8 microprocessors. Successful candidates will, in addition to a competitive salary, receive relocation expenses and an attractive benefits package. Ref. L/48/E

Commercial Systems

West End & City: Salary to £11.5K

A leading International Systems and Software Consultancy with offices throughout the U.K. has recently gained several new contracts in the London area. Additional Senior Programmers and Analyst/Programmers are required to join specialist project teams engaged in the design and implementation of commercial systems on client sites. Applications areas include Accounting,

Stock Control, Order Entry, Banking and Insurance. Candidates should have a minimum of three years programming experience and preferably have a knowledge of COBOL or Assembler. Particular hardware involvement is not important, but it is essential that all applicants demonstrate the ability to adapt easily to new hardware and software. Ref. L/48/F

Mini/Micro Assembler

Holland and Italy: Pkg. to £15K

One of Britain's leading Systems and Software Houses, with a substantial overseas presence, urgently requires Programmers and Senior Programmers to join existing project teams operating from its Dutch and Italian offices. The more senior posts are open to those who have been programming in a real-time environment for at least 18 months.

Applicants for the senior positions will be required to offer a minimum of 3 years' programming experience combined with actual or potential managerial skills. Particular hardware exposure is not a limiting factor but preference will be shown to those familiar with either PDP/11 or micro-processor-based systems. Ref. L/48/G

Senior Sales Engineer

NORTH OF ENGLAND

BASIC SALARY
Negotiable to
£12,000
per annum

Relocation Package Available

We are part of a highly successful British Group of Companies. Our division is dedicated to providing fully supported micro and mini computer based monitoring and control systems to manufacturing and process industry.

Being involved for sometime in both the creative and practical spheres of the now well published mini/micro computer era puts us in a strong position to succeed in this market sector. We now wish to enhance this position by increasing our penetration in the North of England.

Needless to say you will be negotiating at Board level, although your communication skills will be in demand throughout the management spectrum. The ability to recognise potential computer application areas in manufacturing and industrial environments should be well developed as will your expertise in preparing meaningful technical proposals.

You need to be a mature self motivated sales professional well able to identify sales opportunities. However it is stressed that you must have experience in applying micro and mini computer control systems within the manufacturing and process industries.

In return we offer a highly professional small team environment with visible opportunities. A rewarding career is waiting for the right person with a commitment to succeed.

RESEARCH IN HIGHLY PARALLEL AND DISTRIBUTED COMPUTING SYSTEMS

Applications are invited for the position of Research Associate in an on-going project at the Computing Laboratory, University of Newcastle upon Tyne. The project has led to the development of a novel high speed design notation called COSY which has been used to develop highly parallel and distributed system strategies for the sharing of storage and processing power. A final seminar is associated with the notation and has been developed to the point where characteristics such as freedom from dependencies can be simply verified at compile time or at programme formulae non-time.

A successful candidate for the position would be expected to concern himself with the problem of directly implementing the COSY notation, as well as that COSY programmes would run without loss of concurrency or distribution. Candidates should, therefore, have a Ph.D. or equivalent practical experience in computer programming, preferably involving parallel and operating system programming (preferably for concurrent and distributed systems). Appointment will be until 31st December, 1981, commencing on an as possible, and salary will be at a point within the range £A scale £5,500-£9,500 per annum.

Applicants should forward a brief résumé (three copies) together with the names and addresses of three persons to whom references may be made, to Dr P. E. Leach, Computer Laboratory, University of Newcastle upon Tyne, NE1 7RU, not later than 12th December, 1980.

RPG II ANALYST-PROGRAMMER LONDON CITY IBM SYSTEM 34 to £10000

This merchant bank based in the City of London require an Analyst/Programmer to define and implement banking systems which will be based on the IBM system 34 computers. The ideal applicant will have a banking background and at least three years' total experience which will also include one system from feasibility through to implementation.

This is an excellent opportunity for progression to senior management. As one would expect from a leading bank the benefits package is second to none and includes staff restaurant and subsidised mortgage.

Ref. M4812

SENIOR ANALYST CITY ICL 2904 £10000

A long-established shipping company needs a Senior Analyst who can combine in-depth D.P. knowledge with a sound understanding of business and the ability to plan and lead.

Candidates should have at least five years' experience which will ideally have been gained in ICL machinery working on commercial or financial applications in a senior capacity. They should be strategists who can evaluate both hardware and software. A knowledge of communications systems on-line working and word processing would be useful. An excellent benefits package is offered.

Ref. D4850

RPG II PROGRAMMERS MIDDLESEX IBM SYSTEM 38 £8000

A good opportunity has arisen for RPG II programmers with at least one year's experience to join an expanding department based on the West London/Middlesex borders.

An IBM System 38 is due for delivery in 1981 and prior to this existing systems are being enhanced in preparation for the new machine. Systems are currently being run on system 3/15 and system 34 computers.

Company benefits include subsidised restaurant, social club and discount on audio and visual products of the company.

ANALYST PROGRAMMER W. LONDON IBM 4341 c. £9500

A well-known company in the leisure industry seeks a Senior Support Analyst Programmer for a challenging role comprising complete analysis and implementation as well as troubleshooting.

The hardware comprises twin 370 machines to be updated to 4341 supported by DOS/VS, CICS/VS and POWER VS with almost 100 terminals.

Candidates will have at least three and preferably four-five years' experience and will be self-motivated with CICS/VS experience.

In return the company offers subsidised restaurant, pension scheme and season-ticket loan.

Ref. D4781

ANALYST/ PROGRAMMERS CITY PROGRAMMERS £10000

Two international banks are looking for staff to complement their existing teams. Both departments utilise DEC-PDP-11 equipment providing REAL-TIME and batch systems to support the banking operations. AIMS or BANKING experience is essential and the successful applicants can look forward to working in a modern and sophisticated environment offering the usual excellent fringe benefits, which will include mortgage subsidy and season-ticket loan facility.

SENIOR PROGRAMMER ESSEX SYSTIME to £8500

A leading insurance broking company require a SENIOR PROGRAMMER. This is an excellent opportunity to work in a modern and progressive company offering an enviable benefits package which includes FLEXTIME and ANNUAL BONUS. Applicants will have had at least three years' BASIC + experience working to good standards and be capable of leading others. It is essential that SYSTIME or DEC equipment running under RSTSE, RSX or RSM has formed all or part of this experience.

Ref. R4788

PROGRAMMERS CITY BURROUGHS £6-£9000

A successful City-based computer bureau utilising medium sized BURROUGHS equipment has opportunities for all levels of programmers. Applications are invited from programmers with BURROUGHS, COBOL and ideally DATABASE experience. If this has been gained in a bureau or software house environment so much the better. The chance to develop your experience in a wide range of application areas together with excellent prospects is offered and the company also provides a comprehensive benefits package which includes car parking and season-ticket loan.

ANALYSTS SURREY IBM 4341 £8500

An insurance house in North Surrey needs Analysts to complement their team working on IBM machines with CICS and DL1.

A minimum of two years' experience in analysis is required for the junior position where candidates should have worked, preferably in an Analyst/Programmer role.

The more senior position requires 4-5 years with an accounting background. In return the company offers free life assurance, flexitime working, company pension scheme and a subsidised restaurant.

Ref. D4718

The above vacancies are only a small selection from those currently on our files and we are always delighted to talk to experienced systems and programming staff wishing to further their careers.

New and Challenging Opportunities... ...For Marketing and Support People

The company is one of the largest and fastest growing manufacturers in the systems business. It already enjoys a tremendous reputation in the DP and WP field, and sees the future as the uniting of these current technologies together with telecommunications etc. into a fully integrated information system.

A new, powerful marketing team is to be formed to ensure this technical concept is a business success. The head office and field support teams are being extended to make an idea a reality.

The creation of the marketing team offers unrivalled opportunities for marketing, sales or sales support professionals to advance their careers. Similarly the extensions to the support organisation offer the right people the opportunity to develop still further and share in the company's success.

Product Marketing Specialists £15,000-17,000 Pkge + Car

Reporting directly to the U.K. Marketing and Support Manager (these are key positions, interfacing with the U.K. Sales Force and the U.S. Corporate Marketing Division, maximising market penetration and optimising product acceptability. Responsibilities will include U.K. product announcements and launches, supporting documentation, pricing policy, U.K. specific requirements etc. A specialist, probably in the age range 27-39 will be recruited with clear responsibilities in the following three product areas:-

1. **Virtual Storage Computer Based Products**
These are technically advanced data processing products capable of supporting sophisticated communications networks, word processing, electronic mail etc. Candidates should have strong DP backgrounds, marketing, sales or sales support experience, hopefully exposure to IBM equipment and telecommunications, plus the personality and determination to succeed - by helping others succeed.
2. **Word Processing Based Products**
Already a world leader in W.P., the company is pioneering the integration of W.P., D.P., Photo-typesetting, Telecommunications, etc. Again, applicants should have relevant technical backgrounds plus marketing or sales experience, with the right personal attributes for success in marketing.
3. **Small Business Systems**
Here the emphasis is on the marriage of hardware and application software to solve today's defined business problems. Applicants should have marketing capabilities, a good understanding of business and applications packages and the market's requirements in this area. Experience in a software house could be an appropriate background.

Please telephone (24 hour answer service) or write. Quote Ref. CW 162-T

CAPP ASSOCIATES
01-686 9693

Strategic Marketing Analyst £10,000-15,000 Pkge + Car

Again, reporting to the U.K. Marketing and Support Manager, the incumbent will study the market, estimate its potential and the company share, identify and analyse the competition, advise on product pricing and contribute positively to the success of the company's products in the U.K. market. Applicants should have relevant market analysis skills, business awareness, the intellectual ability and judgment to make the right recommendations from incomplete data.

Virtual Computer Product Consultant £10,000-13,000 + Car

A member of the Head Office Technical Support Team, this is a technical role, providing a centre of competence in the organisation for virtual machine products. You will work closely with the Field Support Team but also provide advice to the Product Marketing Specialist. Probably aged 23-36, applicants should have strong technical backgrounds, ideally including IBM DP and telecommunications products.

Branch Support Analyst £10,000-12,000 + Car

Essentially post-sales support work, applicants will require in-depth knowledge of teleprocessing systems, particularly in conversation with IBM hardware and software. There will be a great deal of customer contact, previous experience with a manufacturer or consultancy would be advantageous, as would knowledge of word processing equipment.

WORD PROCESSING BUSINESS SYSTEMS

Our client, Nexos (United Kingdom) Limited, is expanding very rapidly in the growing market for electronic office systems. They are poised to take an important share of this market with a unique range of products which includes a new screen based stand alone word processor and small business system. If you enjoy and can respond to a fast moving environment there has never been a better time to change direction and join a very successful company which is headed for market leadership.

Applications are invited from candidates with a proven record in selling office equipment or business systems to major accounts in industry, commerce (including financial organisations) or the public sector. The job demands above average energy combined with good business judgement.

After a comprehensive training, successful applicants will be given an unparalleled opportunity of broadening their product and application experience, while capitalising on their existing skills to the full. The company is committed to providing extensive and effective sales support as well as a challenging management career path.

There is no ceiling on earnings which include a high basic salary with a guarantee in the first year. The quota is realistic and attainable.

SYSTEMS ANALYST

West London up to £10K

Our client is a well-known British company operating worldwide, their headquarters are in the West of London and they utilize a large IBM 370 mainframe and mini-computers, with on-line and batch techniques.

Due to their continual development of computer systems, they now require a Systems Analyst. If you have a programming background in a high-level language and at least a year's systems analysis experience, ideally gained in a commercial, financial or manufacturing environment on any mainframe, they could be interested in you!

This is an ideal opportunity for the successful candidate to broaden his/her experience working on a wide range of business and technical applications. The company offer structured career development with regular reviews and continued training.

Interested? Contact Lorna Harvey, quoting ref: 1175.

KUWAIT - MINI ENGINEER

c. £12,000 Tax Free + Benefits

A substantial Danish group has a well established computer services operation working in Kuwait and expansion has created the need for a further computer field engineer to be responsible for equipment servicing throughout the country. Installations comprise DEC PDP 11 and Systeime CPU's, with CDC disc units and Tektronix/Calcomp graphic display units.

The company provides business computer systems, software consultancy and computer based telephone systems. Experienced engineers with a sound background of servicing these types of hardware will find this an exceptional opportunity to join an effective and expanding European group.

An attractive salary is offered for the area together with a comprehensive benefits package including car allowance, return air fares to home country for 1 month's holiday and free furnished, air conditioned accommodation. The appointment is initially for two years with 4 weeks bonus on completion and the option to continue.

The requirement is urgent and interviews will be conducted in the U.K. week commencing 16th December 1980.

Engineers having relevant experience should telephone immediately to discuss the requirement and how to apply. Either single or married status is acceptable. Please quote reference CW 164-C.

WE PUT A BIG PRICE TAG ON OUR COMPUTER SALES PEOPLE

Bright go-ahead people want to be part of a growing company that has proved it's going places.

Systime, in only seven years, have gone from zero to be Britain's number one manufacturer of interactive business systems. No other computer company in the world can match its track record.

And Systime are still on the go. Looking for new, key people in their sales force throughout the UK. The rewards are high, the potential, in a company still young and dynamic, great.

SALES EXECUTIVES

On target earnings £20K

Ideally with experience in selling computers, although a proven track record in selling business equipment would be acceptable. A good basic salary plus generous commission becomes £20K on target. Many of our sales executives earn a lot more. Big company benefits apply including a good company car.

For details contact Steve Williams on Leeds 702211 (evenings 7pm to 9pm Thirsk 0845-367415) or write with brief career details to:

Recruitment Manager, Systime Limited,
Concourse Computer Centre, 432 Dewsbury Road,
Leeds LS11 7DF.

Interviews will be arranged on a local basis.

Making Computers make sense.

Communications Hardware Engineer

Our client, a major international banking organisation, is implementing a minicomputer-based, international data-communications network. An outstanding opportunity now exists for a communications specialist to join the bank with responsibility for supervising the European portion of this sophisticated development.

Duties include the supervision of communications hardware installation; maintenance of support documentation covering site manuals, statistical reports, error logs, problem tracking, and inventories; co-ordination of equipment supplies and the utilisation of technical control/test equipment to diagnose/repair network equipment malfunctions.

The requirement is for five years experience as a customer service engineer with computer based telecommunications systems hardware, knowledge of communications protocols and preferably a working knowledge of systems software and programming. The ability to travel confidently throughout Western Europe is essential. Base location: London.

The excellent remuneration package includes a basic salary which is negotiable around £12,000, profit share plan, BUPA, non-contributory pension scheme, and low interest rate loans for personal, property and season ticket use.

Please telephone, in complete confidence, David May at POL who will arrange for qualified applicants to meet the bank at an early date.

THE SALES BIT

Changing jobs at
management level — Part 2Thorny path of
'getting ahead'

THERE are two primary considerations a manager should make when contemplating a change of employment.

What type of job is best suited to his or her talents and experience?

Irrespective of present position what kind of company would be most compatible with personal style and career advancement?

A common failing among managers is a tendency to think more about job and less about career than they did before they entered management. "Find me a management job" is not an uncommon job specification.

It is as if achieving managerial status provides a secure career platform where there is little new to learn or achieve. Career development is considered only in terms of "climbing up the management tree".

Little thought is given to increasing demands on capability, experience and character implicit in the route to the top. "As long as one is on the management train, why worry where it's going to?"

Disillusioned

We all have a natural competence ceiling. The trick of being a successful manager is to stay below it, which is much more difficult than it appears.

Boys of many myths and most managers suggest one is capable of better (usually implying higher) things. One meets many disillusioned managers who have fallen victims of their own propaganda.

On occasions I have candidates who wish to move to a management position in another company and to move to a "higher rank" in the process.

This is particularly true of senior salesmen who wish to move into management, having failed to do so with their current employer.

With the possible exception of an experienced manager within a large company moving to a more senior role in a much smaller organisation, this is virtually impossible.

Risk-taking

It is entirely illogical to expect a company to go outside its own ranks to recruit anyone other than a person with all the experience and skills that cannot be found internally.

To accept anything less would be to invite a management trainee and risks of that kind are taken more satisfactorily with so-called employees than with managers.

Moving as a manager to a small company from a larger one can also lead to unforeseen problems as it is easy to take for granted the facilities and automatic world gap filler. It has a single 3 volt supply with a low power dissipation and is designed to operate over the full military temperature range.

THE rule of thumb is: Sum all percentages given (70 + 75 + 80 + 85 = 310), and then subtract 100 times 11 less than the number of percentages (100 x 11 = 1100). This immediately produces the correct solution of 109%.

It costs £105 in 100-up quantities.

Harris Systems (CW) Harris Semiconductor Division, 145 Parkhurst Road, Slough, Berkshire. Tel: (0753) 34666.

Limelight

The need in become involved in a wider range of activities can bring about the demise of a manager who has no flair for a broader range of responsibilities.

An added problem — managerial status provides a secure career platform where there is little new to learn or achieve.

One can keep out of trouble indefinitely in some larger companies, whereas one's strengths and weaknesses become apparent quickly in a small organisation.

I shall end this theme next week by discussing another kind of job opportunity as well as the financial implications of change.

TRADER

Products

Telex-mate

AN intelligent paper tape touch punch unit is available from Midelectron.

Called the Telex-mate, the unit has the ability to convert level to 8 level and vice versa. Connected to a VDU or word processor, the unit allows tapes to be prepared, leaving the telex free for incoming messages.

It can be connected to any 8 level computer systems.

The one-off unit price is £1,450, with quantity and OEM discounts available.

Midelectron (CW), Midelectron House, Nottingham Road, Derbyshire. Tel: (077382) 6811.

CMOS bus

A CMOS bus interface circuit, designed to be compatible with Arinc specification 429-1, is available from Harris Semiconductor.

Designed to handle 12.5 operates at data rates of 100 or 12.5 kilobits with a one megabit per second option. The unit has a separate receiver and transmitter section with dual and independent receivers connecting directly to the Arinc bus.

The unit features word lengths of 25 or 32 bit, parity status of received data, generate parity of transmitter data and automatic word gap filler. It has a single 3 volt supply with a low power dissipation and is designed to operate over the full military temperature range.

It costs £105 in 100-up quantities.

Harris Systems (CW) Harris Semiconductor Division, 145 Parkhurst Road, Slough, Berkshire. Tel: (0753) 34666.

Puzzle Answer

THE rule of thumb is: Sum all percentages given (70 + 75 + 80 + 85 = 310), and then subtract 100 times 11 less than the number of percentages (100 x 11 = 1100). This immediately produces the correct solution of 109%.
